Appendix F
2014-2015 Red Line Extension Project Update

2014–2015 Red Line Extension Project Update

From 2012-2014, CTA evaluated benefits and impacts of four alternatives: the No Build Alternative, the Bus Rapid Transit Alternative (along Michigan Avenue), the Union Pacific Railroad (UPRR) Rail Alternative, and the Halsted Alternative. CTA evaluated three options of the UPRR Rail Alternative: Right-of-Way Option, East Option, and West Option. CTA also evaluated two options of the UPRR Rail Alternative 130th Street station: a South Station Option and a West Station Option. Based on the project description provided in Section 2 of this technical memorandum, CTA analyzed the impacts of these alternatives and station options. The benefits and impacts are included in the technical memoranda prepared in 2012-2014.

In August 2014, based on the technical analysis and public input, CTA announced the NEPA Preferred Alternative—the UPRR Rail Alternative. Additional conceptual engineering was conducted on the UPRR Rail Alternative to refine the East and West Option alignments. In addition, CTA is considering only the South Station Option of the 130th Street Station.

In late 2014 and early 2015, CTA conducted additional engineering and revised assumptions on the East and West Options to refine the alignments. The refinement of the East and West Options consisted of the following items:

- For the segment of the alignment along I-57, CTA shifted the proposed alignment from the median of I-57 to the north side of I-57 within the existing expressway right-of-way. The construction would be less complex, safer for construction workers, and have a shorter duration. The shift would also allow for fewer impacts to Wendell Smith Park for the East Option, and would allow for no permanent impacts to Wendell Smith Park for the West Option.

- CTA modified the curve speeds as the alignment heads south from I-57 along the UPRR tracks. The curve speed for both the East and West Options would be 35 mph.

- CTA shifted the East Option alignment near 103rd Street station to minimize impacts to Block Park and the Roseland Pumping Station.

- CTA modified the curves south of 103rd Street for both the East and West Options to 55 mph to maximize the train speed.

- CTA refined the layout of the 120th Street yard and shop to optimize yard operations. The refined layout of the yard would accommodate 340 train cars.

The refinement of the East and West Option alignments minimizes potential impacts to parks while providing flexibility for future design phases. The Draft Environmental Impact Statement contains the benefits and impacts of the refined East and West Option alignments and supersedes information presented in other chapters of this technical memorandum.

The refined East and West Option alignments would have no additional or different impacts from those described in the technical memoranda for the following resource areas: construction, transportation, land use and economic development, historic and cultural resources, safety and security, hazardous materials, indirect and cumulative, air quality, floodplains, vegetation and wildlife habitat, threatened and endangered species, and geology and soils.

Section 1
Summary

This technical memorandum analyzes the potential construction impacts of the proposed Red Line Extension (RLE) Project. The analysis draws on the descriptions of construction-related impacts and conclusions described in the other RLE technical memoranda. Section 2 introduces the project, describes the project area, and identifies the alternatives being analyzed in the Environmental Impact Statement (EIS). Section 3 describes the methods of analysis for construction impacts, identifies federal, state and local regulations used in the analysis, identifies analysis thresholds, and describes the area of potential impact (API). Section 4 describes the affected environment. Section 5 describes constructability assumptions and construction segments and phasing. Section 6 describes potential impacts and mitigation measures for each of the RLE alternatives, and Section 7 addresses impacts after mitigation. All RLE alternatives are analyzed in this memorandum. The No Build Alternative would not involve any construction activities, so no construction impacts would occur. Because of the temporary nature of construction activities, the use of construction best management practices (BMP), and the mitigation methods proposed, the construction impacts from the build alternatives would not be adverse.

Updated July 29, 2015

In August 2014, based on the technical analysis and public input until then, CTA announced the NEPA Preferred Alternative—the UPRR Rail Alternative. CTA is considering two alignment (route) options of this alternative: the East Option and the West Option. At this time, CTA is also considering only the South Station Option of the 130th Street Station. In late 2014 and early 2015, CTA conducted additional engineering on the East and West Options to refine the East and West Option alignments. Appendix B of this technical memorandum summarizes the refined alignments and any additional or different impacts that would result. The information in Appendix B supersedes information presented in other chapters of this technical memorandum.

Section 2
Project Description

The Chicago Transit Authority (CTA) proposes to extend the Red Line from the existing 95th Street Terminal to the vicinity of 130th Street, subject to the availability of funding. The proposed RLE would include four stations. Each station would include bus transfer and parking facilities. This project is one part of the Red Ahead Program to extend and enhance the entire Red Line. The CTA is also planning 95th Street Terminal improvements that are anticipated to be completed prior to the proposed RLE construction and are therefore not included in the scope of the RLE Project.

The project area is 11 miles south of the Chicago central business district (commonly referred to as the Loop) and encompasses approximately 20 square miles. The boundaries of the project area are 95th Street on the north, Ashland Avenue on the west, Stony Island Avenue on the east, and the Calumet-Sag Channel/Little Calumet River and 134th Street on the south. The I-57 Expressway and I-94 Bishop Ford Freeway cross the western and eastern edges of the project area, respectively. Lake Calumet is in the eastern portion of the project area. The project area encompasses parts of nine community areas in the City of Chicago and the eastern section of the Village of Calumet Park. Chicago community areas include Beverly, Washington Heights, Roseland, Morgan Park, Pullman, West Pullman, Riverdale, Hegewisch, and South Deering. The project area comprises residential (primarily single family), industrial (both existing and vacant), transportation (including freight), and commercial development.

The Draft EIS focuses on the following alternatives (shown in Figure 2-1), which emerged from the Alternatives Analysis and the National Environmental Policy Act (NEPA) scoping process:

- No Build Alternative
- Bus Rapid Transit (BRT) Alternative
- Union Pacific Railroad (UPRR) Rail Alternative
  - Right-of-Way (ROW) Option
  - East Option
  - West Option
- Halsted Rail Alternative

Figure 2-1: Red Line Extension Project Alternatives

The No Build Alternative is a required alternative as part of the NEPA environmental analysis and is used for comparison purposes to assess the relative benefits and impacts of extending the Red Line service. The No Build Alternative is carried into the Draft EIS phase of the project development regardless of its performance versus the build alternatives under consideration. No new infrastructure would be constructed as part of the No Build Alternative other than committed transportation improvements that are already in the Chicago Metropolitan Agency for Planning Fiscal Year 2010–2015 Transportation Improvement Program including the improvements to 95th Street Terminal. The Transportation Improvement Program projects within the project area consist of four bridge reconstructions, several road improvement projects including resurfacing and coordination of signal timing on 95th Street, work on Metra's facilities, construction of a bicycle/pedestrian multi-use trail, and preservation of historic facilities. The No Build Alternative includes regular maintenance of existing track and structures, and bus transit service would be focused on the preservation of existing services and projects. All elements of the No Build Alternative are included in each of the other alternatives. Under this alternative, travel times would not improve from existing conditions.

The BRT Alternative (formerly referred to as the Transportation Systems Management Alternative) is a 5.0-mile, limited-stop, enhanced BRT route, which is assumed to operate 24 hours per day between the existing 95th Street Terminal and the intersection of 130th Street and Eberhart Avenue. No dedicated bus lanes would be provided for the BRT Alternative; however, parking lanes would be removed for some portions of the alignment and four stops with improved bus shelters and park & ride facilities would be created at 103rd Street and Michigan Avenue, 111th Street and Michigan Avenue, Kensington Avenue and Michigan Avenue, and 130th Street and Eberhart Avenue. Although BRT service elements would not continue south of the 130th Street stop, the bus route would continue through Altgeld Gardens along the existing route with six stops. The BRT Alternative would be consistent with bus routing changes that may occur as part of improvements to the 95th Street Terminal. Under this alternative, travel times between 130th Street and the Loop would improve over existing conditions.

The UPRR Rail Alternative is a 5.3-mile extension of the heavy rail transit Red Line from its existing 95th Street Terminal to 130th Street, just west of I-94. The Chicago Transit Board designated the UPRR Rail Alternative as the Locally Preferred Alternative at its August 12, 2009 board meeting. This alternative includes construction and operation of new heavy rail transit tracks, mostly in existing transportation corridors. The UPRR Rail Alternative has three options for alignment (ROW, East, and West), all of which would include operation on elevated structure from 95th Street to just past the Canadian National/Metra Electric District (CN/ME) tracks near 119th Street. The alignment would then transition to at-grade through an industrial area with no public through streets, terminating at 130th Street in the vicinity of Altgeld Gardens. Four new stations would be constructed at 103rd Street, 111th Street, Michigan Avenue, and 130th Street. The 130th Street station would be the terminal, with two options under evaluation: the South Station Option and the West Station Option. A new yard and shop facility would be sited near 120th Street and Cottage Grove Avenue. The bus routes in the vicinity of the UPRR Rail Alternative would be modified to enhance connectivity between the Red Line and the bus network. The hours of operation and service frequency for the UPRR Rail Alternative are assumed to be the same as the current Red Line. Under this alternative, travel times between 130th Street and the Loop would improve substantially over existing conditions.

The Halsted Rail Alternative is a 5.0-mile heavy rail transit extension of the existing Red Line. In this alternative, the Red Line would operate on an elevated structure running south from 95th Street along I-57 until Halsted Street. The alignment would then turn south and continue along Halsted Street to the intersection of Halsted Street and Vermont Avenue near 127th Street. This alternative would include four new stations at 103rd Street, 111th Street, 119th Street, and Vermont Avenue. The Vermont Avenue station would be the terminal. A new yard and shop would be sited west of Halsted Street and between the 119th Street and Vermont Avenue stations. The bus routes in the vicinity of the Halsted Rail Alternative would be modified to enhance connectivity to the Red Line. The hours of operation and service frequency for the Halsted Rail Alternative are assumed to be the same as for the current Red Line. Under this alternative, travel times between 127th Street and the Loop would improve substantially over existing conditions. This alternative would not extend rail to Altgeld Gardens, which would be served by bus connecting to the Vermont terminal.

Section 3
Methods for Impact Evaluation

This section describes the process used to conduct a macro-level analysis of potential direct and cumulative impacts of construction activities associated with the proposed project. The regulatory framework for the analysis is presented in this section and the potential options to avoid, minimize, and mitigate adverse impacts are discussed in Section 6. Future NEPA analysis, if required for the RLE Project, may provide project-specific analysis of impacts and may provide specific details about the mitigation measures agreed upon by CTA and other project stakeholders.

3.1 Federal Regulations

The project-specific analysis of impacts for the RLE Project is documented in technical memoranda that cover the NEPA resources identified below. The regulatory frameworks relevant to each of these resources are documented in the respective memoranda. Part of the regulatory framework can be applied to construction impacts. The regulatory frameworks for the following resources apply, in part, and are included herein by reference:

- Land Use and Economic Development
- Displacements and Relocation of Existing Uses
- Neighborhood and Community Impacts
- Parklands and Community Facilities
- Visual and Aesthetic Conditions
- Noise and Vibration
- Safety and Security
- Historic and Cultural Resources
- Hazardous Materials
- Air Quality
- Water Resources
- Vegetation and Wildlife Habitat
- Energy
- Environmental Justice
- Transportation

3.2 State Regulations

In addition to the regulatory framework discussed in the other technical reports, the following state regulations apply to construction activities:

- Chapter 15 of 625 ILCS (Illinois Compiled Statutes) 5 - Illinois Vehicle Code includes statutes regarding the maximum size and weight of vehicles that can be lawfully operated throughout Illinois and the network of routes over which these vehicles may operate. Article I describes vehicle size, weight, and load. Article II describes enforcement and recording of weight limit violations. Article III explains special permitting needed to operate or move a vehicle or combination of vehicles of a size or weight of vehicle or load exceeding the maximum specified in this Act.

- The Illinois Department of Transportation's (IDOT) Standard Specifications for Road and Bridge Construction include provisions for dust control. Under these provisions, dust and airborne dirt generated by construction activities would be controlled through dust control procedures or a specific Dust Control Plan, when warranted. In addition, IDOT has developed construction-related Special Provisions dealing with the use of cleaner diesel fuel, idling reduction requirements for construction equipment, and the installation of emission control devices on contractor vehicles.

- Section 5 of 415 ILCS 5 - (Illinois Environmental Protection Act) establishes the Illinois Pollution Control Board. This independent board determines, defines, and implements the environmental control standards applicable in the State of Illinois and may adopt rules and regulations in accordance with Title VII of the Environmental Protection Act. Title 35 of the Illinois Administrative Code contains the Board's substantive pollution control standards and regulations, and the Illinois Environmental Protection Agency's rules for administering the pollution control program. Part 1100, Clean Construction or Demolition Debris, is among the provisions of Title 35 that pertain to construction impacts.

3.3 Local Regulations

The following parts of the Municipal Code of Chicago codify various noise, water quality, air quality, and construction permitting requirements in the City of Chicago. (Regulatory requirements for parts of the project area outside the City of Chicago also apply.)

- Title 9, Chapter 9-72, Section 30 codifies authority to "determine and designate streets or parts of streets upon which the operation of trucks or other commercial vehicles shall be prohibited or upon which the operation of such vehicles shall be restricted by imposing limitations as to the weight of such vehicles." It also requires that "appropriate signs will be erected and maintained on such streets or parts of streets." Section 35 authorizes vehicle weight limitations computed under subsection (g) of Section 15-111 of the Illinois Vehicle Code. These limitations are similar to those imposed by the State of Illinois on "portions of streets and highways under local jurisdiction and will be authorized on designated arterial streets and industrial access routes". Sections 40, 50, and 60 set "the maximum width of any vehicle at 8 feet, the maximum height of any vehicle at 13 feet, 6 inches, the maximum length of single vehicles at 42 feet, and the maximum length of truck tractor and semi-trailer at 55 feet." Section 70 provides "permitting for a vehicle or combination of vehicles not in conformity with the size regulations of this chapter or the wheel and axle load and gross weight provisions of Section 15-111 of the Illinois Vehicle Code."
- Title 11, Chapter 11-16, Section 120 prohibits discharging "any prohibited wastes as defined by the Metropolitan Water Reclamation District of Greater Chicago (MWRD), the department of health or any other governmental agency, or any other material which the commissioner determines is likely to obstruct or stop the flow of wastewater in the public sewer system."

3.4 Impact Analysis Thresholds

NEPA does not set specific thresholds of significance for construction-related impacts; however, there are construction-related thresholds of significance for some of the NEPA resources included in this analysis. The analyses for various resources were used as the basis for the qualitative and quantitative evaluations referenced in this document, and to determine the thresholds of significance for each resource.

For this analysis, the impact categories are as follows:

- **Beneficial** - Impact that positively affects the community**.**
- **No Impact** - No adverse or beneficial impact on the resource would result.
- **Not Adverse** - Would not result in a negative impact on the resource.
- **Not Substantially Adverse -** A negative impact on the resource would result, but it would not be severe, or it could be mitigated to minimize the impact.
- **Adverse** - Negative impact to the community that cannot be mitigated.

For the purpose of this EIS, a construction impact would occur if an impact threshold identified for any of the resources were to be exceeded during proposed construction activities.

3.5 Area of Potential Impact

Two kinds of construction impacts are considered in determining the API for a project. Direct impacts are caused by the proposed project and occur at the same time and place (40 Code of Federal Regulations [CFR] 1508.8). They are immediately related to project activities, and include impacts that result from construction, such as construction noise. Direct impacts occur at facilities and adjacent to the project. Cumulative impacts are those that result from the incremental impact of the proposed project when added to other past, present, and reasonably foreseeable future actions, regardless of what agency or person undertakes such other actions (40 CFR 1508.67).

The API for direct impacts due to construction is based on the API for the NEPA resources analyzed. The largest geographic API for direct impacts due to construction is generally bounded on the north by 91st Street; on the south by 134th Street; on the east by Martin Luther King Drive (91st Street to 99th Street) and I-94 (99th Street to 134th Street); and on the west by Halsted Street (91st Street to 95th Street), Racine Avenue (95th Street to 99th Street), and I-57 (99th Street to 134th Street). Direct impacts due to construction and construction-related traffic in this area would primarily affect traffic patterns and land uses along roadways classified as principal and minor arterials, and major and minor collectors. In subsequent phases of the RLE Project, design activities would identify potential locations of material sources, contractor storage and staging areas, and other details that determine construction access routes.

The mid-size API applied for direct impacts due to construction is primarily relevant for non-motorized travel, including pedestrians and bicyclists. One-half mile is a generally accepted distance for travel by non-motorized means for analyses such as land use and economic development impacts, neighborhood and community impacts, and parklands and community facilities impacts. The mid-size API is defined as follows for the respective alternatives:

- **BRT Alternative** - Extends ½ mile on each side of the center of the proposed alignment, from the 95th Street Terminal to the station location at 130th Street and Eberhart Avenue.
- **UPRR Rail Alternative** - Extends ½ mile on each side of the center of the proposed alignments, from the 95th Street Terminal to the 130th Street station location.
- **Halsted Rail Alternative** - Extends ½ mile on each side of the center of the proposed alignment from the 95th Street Terminal to the 127th Street/Vermont Avenue station location.

The smallest APIs are based on unique characteristics of a specific site or sites. A micro-level API is used for analysis of construction impacts on site-specific environmental resources. An example of construction impacts on a site-specific environmental resource includes construction noise and vibration impacts on a historic site adjacent to the RLE alignment. When otherwise not specifically stated, the API for direct impacts due to construction noise includes parcels within 600 feet of the existing and proposed ROWs for the each of the alternatives (Chicago City Code Section 11-4-2835).

The area used to analyze cumulative impacts due to proposed construction activities is based on the RLE *Cumulative Impacts Technical Memorandum*. In general, the API for cumulative impacts includes broader geographic areas than those for direct impacts. The API for cumulative impacts reflects the distribution of the individual resources and is not limited to the project area; it consists instead of the boundaries specific to the resources, such as the construction limits for a transportation improvement, private development, or another public infrastructure project that is near enough to the project and being performed at the same time, potentially inducing cumulative impacts.

3.6 Methods

The analysis is based on considerations including potential construction methods, staging, and possible impacts on environmental resources. The impacts were identified during the analysis performed for each of the NEPA resources. Construction impacts are temporary in nature and are not relevant to the operation of transit services once the proposed project has been constructed. Impacts associated with post-construction activities were therefore not included in this analysis.

Section 4
Affected Environment

The affected environment for construction impacts depends on the geographic frame of reference used to analyze existing conditions for each of the environmental resources listed in Section 3. Analysis of the resources used the geographic frames of reference most relevant to each field of study: the API, community areas, or designated track segments.

4.1 Analyzed by Area of Potential Impact

Resource analyses that considered general environmental conditions or the built environment at a macro level were described by API. Section 6 provides additional information regarding APIs for each environmental resource. The resources framed by API include the following:

- Parklands and Community Facilities
- Noise and Vibration
- Safety and Security
- Hazardous Materials
- Air Quality
- Water Resources
- Energy
- Environmental Justice
- Transportation

4.2 Analyzed by Community Areas

The project area encompasses parts of nine community areas in the City of Chicago and the eastern section of the Village of Calumet Park. Chicago community areas include Beverly, Washington Heights, Roseland, Morgan Park, Pullman, West Pullman, Riverdale, Hegewisch, and South Deering. The project area comprises residential (primarily single-family), industrial (both existing and vacant), transportation (including freight), and commercial development. The API for direct impacts due to RLE Project construction activities varies depending upon the API for each of the resources analyzed. Community areas were used for these resources based on the public's understanding of cultural context and community boundaries. These resources include the following:

- Land Use and Economic Development
- Displacements and Relocation of Existing Uses
- Neighborhood and Community Impacts
- Historic and Cultural Resources

4.3 Analyzed by Segments of Track

The API for some resources was subdivided into several track segments as shown in Figure 4-1 at the end of this section. Analysis by track segment frames the impact on resources that may be more susceptible to construction impacts, and accounts for a variety of construction techniques that may apply only to specific segments of track. Resources described by track segment include the following:

- Visual and Aesthetic Conditions
- Vegetation and Wildlife Habitat

Track segments provide a framework for proposed sequencing and coordination with CTA operations and overall construction activities. The segments were also developed so that construction activity in a particular segment could function as a separate contract.

Figure 4-1: Red Line Extension Alternatives - Construction Segment Map

Section 5
Description of Construction

This section is based on and references the *Description of Construction and Phasing for Environmental Impact Statement Build Alternatives*. A summary of the report is provided below. For specific details regarding construction sequencing and phasing, please refer to Section 3 of the *Description of Construction and Phasing for Environmental Impact Statement Build Alternatives*. The report details the construction activities for the BRT Alternative, UPRR Rail Alternative, and Halsted Rail Alternative (the build alternatives).

The following are the major constructability, construction sequencing, and phasing assumptions. Phasing and construction segments may change due to refined engineering, available funding, and other factors later in the project implementation stage. Construction activities involving caisson construction, train rerouting, CTA/UPRR track shutdowns, trackwork, elevated structures, structural steel erection, and pile placement would only be associated with the rail alternatives.

5.1 Constructability Assumptions for the Bus Rapid Transit Alternative

The coordinated construction of infrastructure and stops is a key component of planning and design. Assumptions that affect design solutions include the following:

- The location of stops and parking facilities.

- The ability to perform construction so as to facilitate CTA operations, specifically near the 95th Street Terminal, UPRR operations, and adjacent vehicle traffic.

The following parameters have been assumed for the BRT Alternative:

- The methods of construction required along the proposed alignments would be conventional, using standard construction methods and materials including cast-in-place concrete and pre-cast concrete.

- Streets with adjacent alleys would be used for site access during construction.

- Space for storage and staging of construction materials, equipment, and temporary facilities would occur within the immediate construction zone or work area. Construction material storage and contractor yard areas would also be available at the proposed parking areas.

- Temporary shutdown of traffic would occur at nighttime and during low-traffic-volume intervals per IDOT and CDOT approval.

- Streets, along with adjacent alleys, would be closed temporarily or the number of travel lanes may be reduced for truck queuing and other construction activities.

5.2 Constructability Assumptions for all Rail Alternatives

The coordinated construction of infrastructure and stations is a key component of planning and design. Assumptions that affect design solutions include the following:

- The location of stations, parking facilities, and yard locations.
- The type of aerial structure. New construction of aerial structures would include foundation, columns, and decking. New construction of retained embankment structures would include foundation and two parallel reinforced concrete retaining walls with fill in between.
- The ability to construct facilities in phases to facilitate CTA operations, specifically near the 95th Street Terminal, the 95th Street substation, and 98th Street Yard and Shop.
- The ability to construct facilities in sequences and phases to facilitate UPRR operations.
- The location and size of proposed foundations and structural members that are potentially limited by clearance requirements (e.g., caisson size and depth, concrete pour access, piece weight and size, and similar).
- The ability to phase construction of structures to facilitate traffic operations on I-94 and 1-57.

The following parameters have been assumed for all rail build alternatives:

- The methods of construction required along the proposed alignments would be conventional, using standard construction methods and materials including cast-in-place concrete, pre-cast concrete, and structural steel.
- Streets with adjacent alleys would be used for site access during construction. New construction in and adjacent to the 95th Street Terminal would require track shutdowns in order to access the work site. To perform this work in an efficient manner, while maintaining reasonable service and access to the 98th Street Yard and Shop, it is anticipated that construction would be sequenced and phased to maintain some level of access to the 98th Street Yard and Shop.
- Space for storage and staging of construction materials, equipment, and temporary facilities would occur within the ROW. Construction material storage and contractor yard areas would be available at the proposed parking areas and/or maintenance yard. Construction access adjacent to the ROW could be required, especially during viaduct and station construction activities.
- During construction, access to work zones adjacent to the expressway would require shoulder and lane closures. For the superstructure erection over expressway traffic lanes, temporary shutdown of all traffic would be required. Temporary shutdown of traffic would only occur at nighttime and during low-traffic-volume intervals per IDOT and CDOT approval. Construction adjacent to or over railroads would require flagging operations and scheduled track closures.

- It is anticipated that streets crossed for station and viaduct construction would be closed temporarily and/or the number of travel lanes would only be reduced during heavy construction activities.

5.3 Construction Phasing and Segments

Phasing construction and performing construction in segments would allow CTA to limit the duration of impacts in a given area rather than potentially affecting resources and areas along the entire corridor simultaneously. Every attempt would be made to group as many construction activities as possible in a given area in order to maximize efficiency and limit the duration of the impact. Phasing and segmenting construction activities also allows for more focused analysis of potential impacts along a corridor that may have several different concentrations of resources and land uses. Construction activities would be grouped by type of work and location. The overall schedule and coordination of all construction segments would be phased and scheduled to maintain CTA operations at the 95th Street Terminal, the 95th Street substation, and 98th Street Yard and Shop, and vehicular traffic on affected expressways and roadways. Figure 4-1 shows the alignments of all alternatives and the construction segments where applicable.

5.3.1 Bus Rapid Transit Alternative

The corridor for the BRT Alternative consists of one segment for the purposes of describing construction activities. Work activities would include new construction of the following:

- BRT shelters and amenities at BRT stops and park & ride facilities.
- Pavement markings, crosswalks, and signage.
- Americans with Disabilities Act-compliant ramps, bus pads, and lighting at BRT stops.
- A traffic signal at the 130th Street/Eberhart Avenue intersection.
- Transit signal priority detectors and the improvement of traffic signal controllers at existing signalized intersections.

Construction activities would also include utility relocation, sidewalk improvements, and the removal of on-street parking spaces at the proposed BRT stop locations.

All of the construction work activities may require temporary shutdown of traffic, and possible CTA and Pace bus rerouting, which would occur during non-peak and during low-traffic-volume intervals per IDOT and CDOT approval. Work zones along the BRT Alternative would likely require temporary lane closures. Work would be sequenced to minimize impacts and access to adjacent roadways and both commercial and residential buildings.

Additional buses associated with the BRT Alternative would be stored and maintained at other CTA bus garages, such as the 103rd Street Garage.

5.3.2 Union Pacific Railroad Rail Alternative - Right-of-Way Option

The UPRR Rail Alternative corridor is divided into seven segments for the purposes of describing construction activities.

A proposed 270-car yard and shop facility, to be located at 120th Street and Cottage Grove, is included as part of all three UPRR Rail Alternative options. The facility would be located on a combination of industrial and vacant land east of the CN/ME tracks and west of the Northern Indiana Commuter Transportation District/Chicago South Shore & South Bend Railroad (NICTD/CSS & SBRR) tracks. The yard would be entirely at grade. A nominal amount of parking for employees would be included. A proposed substation within the 120th Street yard and shop west of the existing railroad tracks and east of the proposed facility may be included as part of the facility.

5.3.2.1 UPRR-ROW Segment U-1

Work activities in UPRR ROW Option Segment U-1 would include the following:

- New trackwork and signals to tie into the 95th Street Terminal.
- New construction of a retained fill structure south of the 95th Street Terminal.
- New construction of single-track, elevated structures over existing CTA tracks leading to the 98th Street Yard and Shop and over the existing CTA/southbound I-94 tunnel.
- New construction of dual-track, elevated structure through the I-94/I-57 interchange, across the westbound (WB) I-57 entrance ramp from northbound (NB) I-94, and along the I-57 corridor.
- Proposed structure construction would be sequenced to minimally affect traffic flow on the WB I-57 entrance ramp from NB I-94. For superstructure erection over the expressway traffic lanes, temporary shutdown of all traffic would be required. Temporary shutdown of traffic would occur at nighttime and during low-traffic-volume intervals per IDOT and CDOT approval.

It may be necessary to relocate trackwork leading from the 95th Street Terminal to the existing 98th Street Yard and Shop to allow construction of proposed substructure within the CTA ROW. Tying proposed trackwork and structure into existing trackwork at the 95th Street Terminal would be sequenced to provide rail car access to the 98th Street Yard and Shop. Proposed structure construction would be sequenced to maintain operating routes from the 95th Street Terminal to the 98th Street Yard and Shop, as well as maintain traffic flow on I-94 through the tunnel.

Superstructure erection over the CTA tracks, I-94, the WB I-57 entrance ramp from NB I-94, and Wentworth Avenue would require temporary shutdown of expressway traffic and CTA non-revenue operations to the yard. Temporary shutdown of traffic would occur during non-peak and low-traffic-volume intervals per IDOT and CDOT approval. CTA non-revenue operations would be shut down during off-peak hours or weekends. Work would be sequenced to minimize impacts on traffic flow on the I-57/I-94 interchange, as well as in the I-57 corridor. Work zones adjacent to the expressway would require shoulder closures and possibly lane closures.

5.3.2.2 UPRR-ROW Segment U-2

Work activities in UPRR ROW Option Segment U-2 would include new construction of dual-track, elevated structure consisting of multiple types of superstructure and substructure spanning I-57 and within the UPRR corridor.

Work would be sequenced to minimize impacts on traffic flow on I-57. Work zones adjacent to the expressway would require temporary shoulder and lane closures. Superstructure erection over I-57 would require temporary shutdown of NB traffic.

5.3.2.3 UPRR-ROW Segment U-3

Work activities in UPRR ROW Option Segment U-3 would include the following:

- New construction of an elevated structure within the UPRR corridor.
- Construction of new stations at 103rd Street, 111th Street, and Michigan Avenue.
- Construction of two new substations.
- Construction of surface parking lots and bus turnarounds at the proposed 103rd and 111th Street stations.
- Construction of a parking garage and bus turnaround at the proposed Michigan Avenue station.

All existing structures and underground utilities would be identified. All existing utilities would be protected or relocated.

5.3.2.4 UPRR-ROW Segment U-4

Work activities in UPRR ROW Option Segment U-4 would include the following:

- New construction of dual track and an elevated structure within the UPRR corridor, branching off and running along the east side of the corridor over the CN/ME tracks.
- New construction of an elevated structure to the 120th Street yard and shop tie-in.
- New construction of a retained embankment structure to carry the elevated structure to grade.

Construction at the CN/ME crossing would be phased to minimize impacts on CN and Metra operations. Construction over and adjacent to the railroads would require flagging operations and potential limited track closures.

5.3.2.5 UPRR-ROW Segment U-5

Work activities in UPRR ROW Option Segment U-5 would include the new construction of track roadbed at grade and the construction of the MWRD access road and bridge over the proposed CTA tracks and the NICTD/CSS & SBRR crossing.

5.3.2.6 UPRR-ROW Segment U-6S

There are two station options for the 130th Street Station: a South Station Option (U-6S) and a West Station Option (U-6W).

Work activities in UPRR ROW Option Segment U-6S would include the following new construction:

- Track roadbed
- The 130th Street station including parking lots and multi-story garage
- Areas for land development, bus bays, and road access for the 130th Street station
- The MWRD access road to the 130th Street station
- One new substation

Coordination with MWRD would be necessary to maintain current operations during new track roadbed construction and during the new road access for the 130th Street station. If necessary, construction would be sequenced to construct the MWRD access road to the west of the station first, allowing MWRD facilities to continue operation. Coordination with the NICTD/CSS & SBRR would be necessary because construction over and adjacent to the railroads would require flagging operations and scheduled track closures.

5.3.2.7 UPRR ROW Segment U-6W

Work activities in UPRR ROW Option Segment U-6W would be similar to those in U-6S with the addition of crosswalks, a signalized intersection at 130th Street and Evans Avenue, and a bridge, in addition to a road at 130th Street.

Coordination with MWRD would be necessary to maintain operations during construction of the new access road for the 130th Street station. If necessary, construction would be sequenced to construct the proposed MWRD access road and bridge crossing the proposed CTA tracks first, thus allowing MWRD facilities to continue operation. Coordination with the NICTD/CSS & SBRR would be necessary because construction over and adjacent to the railroads would require flagging operations and scheduled track closures.

5.3.2.8 UPRR ROW Segment U-7

Construction for the 120th Street yard and shop would be scheduled and coordinated to maintain operations at the MWRD facilities. Work would be sequenced to minimize impacts on adjacent roadways and both commercial and residential buildings. Construction activities associated with the 120th Street yard and shop would include the following:

- New construction of dual track and elevated structure, new yard and track, shop building, shop access road, and parking.
- Potential construction of a new substation.

5.3.3 Union Pacific Railroad Rail Alternative - East Option

The corridor is divided into seven segments for the purposes of describing construction activities.

5.3.3.1 UPRR East Option Segments U-1 and U-2

Construction and phasing activities would be the same as for the UPRR ROW Option.

Work activities would be sequenced to minimize impacts on traffic flow on I-57 and UPRR operations. Work zones adjacent to the expressway would require temporary shoulder and lane closures. Superstructure erection over I-57 would require temporary shutdown of NB traffic. Construction adjacent to railroads would require flagging operations and scheduled track closures.

5.3.3.2 UPRR East Option Segment U-3

Work activities in UPRR East Option Segment U-3 would include the following:

- Demolition of existing buildings and structures in the proposed ROW where necessary.
- New construction of dual-track, elevated structure consisting of multiple types of superstructure and substructure along the east side of the UPRR corridor.
- New construction of stations at 103rd Street, 111th Street, and Michigan Avenue.
- New construction of surface parking lots and a bus turnaround at 103rd Street station and 111th Street station and new construction of a parking garage and bus turnaround at the Michigan Avenue Station.
- Construction of two new substations.

Work would be sequenced along the UPRR corridor to minimize impacts on UPRR operations. Construction adjacent to railroads would require flagging operations and scheduled track closures. Possible signaling would be needed to replace existing signaling during construction of viaducts for the following at-grade UPRR crossings: 101st Street, 103rd Street, 107th Street, 109th Street, 111th Street, Michigan Avenue, and State Street. All existing structures and underground utilities would be identified, protected, or relocated as described for UPRR ROW Segment U-3.

5.3.3.3 UPRR East Option Segment U-4

Work activities in UPRR East Option Segment U-4 would include the following:

- Demolition of existing building and structures in the proposed ROW where necessary.
- New construction of dual-track, elevated structure along the east side of the UPRR corridor and over the CN/ME tracks.
- New construction of UPRR yard and shop track tie-in.

5.3.3.4 UPRR East Option Segments U-5, U-6S, U-6W, and U-7

The phasing activities would be the same as those described for the UPRR ROW Segments U-5, U-6S, U-6W, and U-7.

5.3.4 Union Pacific Railroad Rail Alternative - West Option

The corridor is divided into seven segments for the purposes of describing construction activities.

5.3.4.1 UPRR West Option Segments U-1 and U-2

Construction and phasing activities for the UPRR West Option would be the same as for the UPRR ROW Option.

Work activities in zones adjacent to the expressway and Eggleston Avenue may require temporary shoulder and lane closures. Superstructure erection over I-57 and the UPRR corridor would require temporary shutdown of NB traffic and UPRR operations. Construction adjacent and across railroads would require flagging operations and scheduled track closures.

5.3.4.2 UPRR West Option Segment U-3a

This portion of the alignment would extend from the end of the horizontal curve at the UPRR crossing to the Prairie Street crossing. Work activities in UPRR West Option Segment U-3a would include the following:

- Demolition of existing buildings and structures in the proposed ROW.
- New construction of dual track and elevated structure along the west side of the UPRR corridor.
- New construction of stations at 103rd Street, 111th Street, and Michigan Avenue.
- New construction of surface parking lots and bus turnarounds at the 103rd Street station and the 111th Street station and new construction of a parking garage and bus turnaround at the Michigan Avenue station.

Work would be sequenced along the UPRR corridor to minimize impacts on UPRR operations. Construction adjacent to railroads would require flagging operations and scheduled track closures. Signaling may be needed to replace existing signaling during construction of viaducts for the following at-grade UPRR crossings: 101st Street, 103rd Street, 107th Street, 109th Street, 111th Street, Michigan Avenue, and State Street.

5.3.4.3 UPRR West Option Segment U-3b

This portion of the alignment would extend from the Prairie Street crossing to the CN/ME crossing. Work activities in UPRR West Option Segment U-3b would include the following:

- New construction of dual-track, elevated structure along the east and west side of the UPRR corridor, as well as across the UPRR tracks, would consist of multiple types of super- and substructure spanning along and across the UPRR corridor and Prairie Avenue.

Work would be sequenced along and across the UPRR corridor to minimize impacts on UPRR operations. Construction adjacent to railroads would require flagging operations and scheduled track closures. Work zones adjacent to Prairie Avenue may require lane closures and may cause temporary shutdown of all traffic.

5.3.4.4 UPRR West Option Segment U-4

Work in UPRR West Option Segment U-4 would include the following:

- Demolition of existing buildings and structures in the proposed ROW as necessary.
- New construction of dual-track, elevated structure along the east side of the UPRR corridor and over the CN/ME tracks.
- New construction of the 120th Street yard and shop track tie-in.
- New construction of retained embankment structure to carry elevated structure to grade.

5.3.4.5 UPRR West Option Segment U-5

Construction and phasing activities in U-5 would be the same as those described for UPRR ROW Segment U-5.

5.3.4.6 UPRR West Option Segments U-6S, U-6W, and U-7

Construction and phasing activities in U-6S, U-6W, and U-7 would be the same as those described for the UPRR ROW Option.

5.3.5 Halsted Rail Alternative

The corridor is divided into five segments for the purposes of describing construction activities.

The proposed 119th Street yard and shop would be located south of the 119th Street station and north of the Vermont Avenue station west of Halsted Street. The parcel on which the yard would be constructed is west of the 119th Street park & ride location. Track height would transition from elevated at station height to at grade between Halsted Street and Morgan Street, through the park & ride facility. The yard would be entirely at grade. A nominal amount of parking for employees would be included at the yard.

5.3.5.1 Halsted Segment H-1

Work activities in H-1 would include the following:

- New trackwork and signals to tie into the 95th Street Terminal.
- New construction of retained fill structure south of the 95th Street Terminal.
- New construction of single-track, elevated structures over the existing CTA tracks leading to the 98th Street Yard and Shop and over the existing CTA/southbound I-94 tunnel.
- New construction of dual-track, elevated structure through the I-94/I-57 interchange, across the WB I-57 entrance ramp from NB I-94, and along the I-57 corridor.
- Proposed structure construction would be sequenced to minimally affect traffic flow on the WB I-57 entrance ramp from NB I-94. For superstructure erection over expressway traffic lanes, temporary shutdown of all traffic would be required. Temporary shutdown of traffic would occur at nighttime and low-traffic-volume intervals per IDOT and CDOT approval.

The phasing activities would be the same as for UPRR Rail Segment U-1.

5.3.5.2 Halsted Segment H-2

Work activities in H-2 would include new construction of dual track and elevated structures consisting of multiple types of super- and substructure spanning along and across I-57 and across Halsted Street. Work zones adjacent to and across the expressway may require shoulder and lane closures. Superstructure erection would require temporary shutdown of NB traffic on I-57 and at the intersection of 99th Street and Halsted Street.

5.3.5.3 Halsted Segment H-3

Work activities in H-3 would include the following new construction:

- Dual track and an elevated structure consisting of multiple types of super- and substructure spanning along Halsted Street
- Stations at 103rd Street and 111th Street
- A surface parking lot and bus turnaround at the 103rd Street station
- A surface parking lot at the 111th Street station
- Two new substations

Work would be phased to minimize traffic impacts on Halsted Street and adjoining streets. The construction of the elevated structure would require lane and street closures. In order to increase roadway capacity, parking along Halsted Street would potentially be eliminated during construction. Superstructure erection would require temporary shutdown of all traffic along segments of Halsted Street during off-peak or weekend hours. Traffic would be detoured to the next major north/south roadway to minimize traffic impacts. Detour routes for Halsted Street would be identified in a Maintenance of Traffic Plan as part of final engineering.

5.3.5.4 Halsted Segment H-4

Work activities in H-4 would include the following new construction:

- Dual track and an elevated structure consisting of multiple types of super- and substructure spanning along Halsted Street
- Stations at 119th Street and Vermont Avenue
- A surface parking lot and bus turnaround at the 119th Street station
- Both a surface parking lot and a parking garage, as well as bus bays, at the Vermont Avenue station
- Two new substations
- Three tracks and an elevated structure south of the Vermont Avenue station
- A surface parking lot at the 111th Street station

The phasing activities for Halsted Segment H-4 would be the same as for Segment H-3.

5.3.5.5 Halsted Segment H-5

For analysis of construction, the 119th Street yard and shop has been separated from the Halsted Rail segments. Work would be sequenced to minimize impacts on adjacent roadways and buildings. Work activities for the 119th Street yard and shop would include the demolition of existing buildings and structures in the proposed ROW where necessary and construction of a new yard, track shop building, shop road access, and parking.

5.4 Potential Construction Staging Areas

Construction staging would be within the proposed ROW or within construction easements of stations/stops and alternative alignments. The following provides a general description of the types of properties that may be used for construction staging in order to minimize impacts:

- Parcels to be acquired by CTA for the implementation of a given alternative would be used as staging areas. Whole parcels or groups of parcels may be acquired and used for the RLE Project. After construction, residual property may be sold.
- Nearby parking lots may be used through the establishment of temporary construction easements.
- Abandoned adjacent parcels may be used through the establishment of temporary construction easements.

In the event of limited available space adjacent to the construction site, off-site CTA, municipal, or privately owned storage yards may need to be provided for the contractor's use. This would allow secure storage of an equipment fleet or permanent materials needing large storage or assembly areas.

5.5 Anticipated Construction Activities and Methods

5.5.1 Basic Construction Activities and Methods

A summary of potential construction activities and methods for the build alternatives is presented in the Construction Matrix within Appendix A. The intent of the Construction Matrix is to provide a general level of construction activity that may occur with each alternative. The Construction Matrix identifies a range of activities based on currently available information and is not intended to be used for scheduling construction, nor is it intended to be used for estimating construction cost.

Terms used to describe quantities of construction materials and durations of construction activities are based on the *Description of Construction and Phasing for Environmental Impact Statement Build Alternatives*. Some, but not all, of these terms are defined below.

- Duration (Months) - Estimated number of months a work activity would be required. Activities would not be sequential, except for advance work if required in the segment. Construction phasing and the need to maintain transit operations would affect the duration of construction activities.

- Construction Equipment - Possible types of construction equipment that may be used for a particular duration within an activity.

- Soil (cubic yards) - Potential amount of cubic yards of earthwork that may be excavated or removed. Concrete removed is included in the soil quantity. Soil removed to install structural caissons and foundations is included in this category.

- Concrete (cubic yards) - Represents the potential quantity of concrete to be placed, including that for caissons and concrete repair areas. Concrete at stations/stops includes concrete used for buildings and platforms. Concrete for track support is included under column concrete in the Elevated Structure activity.

- Structural Steel (pounds) - Represents the potential quantity of new structural steel weighed in pounds. Structural steel at stations includes steel used for buildings and platforms. Structural steel for track support is included in the Elevated Steel Structure activity.

- Average Truck Trips Per Workday - Estimation of the average number of truck trips per workday for an activity. The activity does not include smaller vehicles used for administrative and management purposes or vehicles used by workers to commute to and from the work site.

- Average Workers Per Workday - Estimation of the average number of workers for an activity per workday.

5.5.2 Preconstruction Activities

Contractor preconstruction activities would include development of construction schedules, quality plan, procurement schedules, and would include the following activities as well:

- Process plans would be developed for coordination of work activities to match construction constraints and site access.
- Existing conditions would be verified for design and construction interface criteria. Survey controls would be established for verification of site, existing conditions, and utility conflict/relocation information.
- Utility protection/relocation information would be coordinated and verified in sequence of scheduled construction far in advance of the early construction activities.
- Community notifications would be initiated by the CTA and the Contractor, as early as possible.
- Demolition and building permits would be obtained at the earliest opportunity. City of Chicago Office of Underground Coordination requirements (e.g., shoring designs, support of excavation, caisson procedures) would be met and approved for permits.
- Any special trackwork/signal work/interlocking requirements would be coordinated or procured by the CTA in advance of project procurement and in sequence with any schedule requirements.
- Compliance with all CTA Quality Control and the International Organization for Standardization (ISO) requirements.

5.5.3 Traffic Rerouting

During construction, vehicles, pedestrians, buses, and trains may need to be rerouted around the construction sites. Rerouting of traffic may be done using detours and/or complete street closures. The street closures could include main streets and side streets, as well as alleys and access points. Station and viaduct construction activities, for the rail construction, would be sequenced around street and alley closures. Temporary traffic lanes, temporary access points, or staged construction would be used. The following activities would be part of the traffic rerouting activities:

- Construction signage and temporary traffic barriers, accessibility adjustment (temporary curb ramps).
- Temporary reductions in number of thru-traffic lanes in each direction from two to one, if feasible.
- Detours/complete street closures, including alleys and access points.
- Temporary traffic lanes.

- Construction vehicle access points within and/or adjacent to the ROW.
- Business, residential, and pedestrian impacts including limited parking or parking bans.
- Advance trackwork and signalization to facilitate train rerouting.
- Alternate bus routes and temporary CTA outages may be required during construction of the RLE Project at the 95th Street Terminal.
    - CTA track shutdowns during nights or weekends may be required.
    - Trains would operate on one or two tracks through the construction zones. Flagmen would be required to notify trains of construction activities.

5.5.4 Demolition

Demolition of existing buildings and structures in the proposed ROW would be required. The demolition process would result in increased noise, debris, roadway closures, and construction vehicle access. Work would be performed within parameters of local ordinances for construction activities. In general, pedestrian and vehicular traffic would not be allowed into the area of demolition.

The demolition process would include concrete removal, which would require construction workers to saw cut, jackhammer, knock out the existing concrete, cut or remove the existing reinforcement, or complete demolition of the concrete structures.

To remove foundations or streets, or to relocate existing utilities, the contractor would have to excavate with bulldozers, bobcats, or backhoes to dig and remove the earth. The material to be disposed would be placed in dump trucks and hauled offsite.

Construction vehicles would be accessing the construction site on a regular basis and would require special hauling routes to remove the debris and deliver materials and equipment to the site. The routes may require temporary shutdown of streets, complete closures, or rerouting of traffic. There is ample street capacity and land available for construction staging in the project area. While specific construction routes have not been finalized for the project, it is anticipated that impacts would either be avoided or readily mitigated. This conclusion will be confirmed after designation of a NEPA Preferred Alternative and completion of a detailed construction management plan including routing. Depending on the type of material that would be removed, special handling of waste may be necessary.

5.5.5 Temporary Shoring

During demolition and excavation, temporary shoring may be required to protect adjacent property and/or tracks. The shoring would consist of steel sheet piling that would be driven into the ground with a vibratory pile driver. The rig may be placed within the construction zone or outside the ROW, depending on space limitations and access points. The temporary shoring may require the use of tiebacks, which are long rods that would be drilled through the sheet piling, embedded into sound rock or other approved materials, and then grouted into place.

5.5.6 Foundations

Due to the variety of structures, including CTA elevated structure, stations/stops, and parking garages, there would be a variety of foundations on the RLE Project. Foundations could consist of concrete spread footings, steel pile foundations, or concrete caisson foundations with caisson caps to transition to exposed columns. The type of foundation depends on the site conditions and structure type.

All types of spread or shallow type foundations would require excavation and removal of earth to form the concrete footings. Bulldozers, bobcats, or backhoes would be used to dig and remove the earth. The earth may be placed in dump trucks and hauled off site or stored for use on the construction site for backfill.

Large cranes with pile-driving leads that help guide the piles into position would be used for the installation of a pile foundation. A diesel hammer would drive the piles into the ground by impact. Pile shoes or pile tips added to the end of a pile or a pre-drilled hole supported by a steel casing could be used to aid the pile installation process.

Caisson construction would also be performed with a crane-mounted drilling rig. An auger of the design diameter would be drilled into the ground and the spoils would be piled nearby for removal. As the auger advances, extensions are added to the supporting shaft. Often, the drilled hole is fitted with a lining when unstable soils are encountered. A pre-formed reinforcement cage would be installed and concrete would be placed to form the caisson support.

5.5.7 Concrete Placement

Determination of the concrete plant location, based on availability of the required concrete mix, is an important part of the construction logistics and process plan. The plant would supply and deliver the concrete to the site using concrete trucks. Temporary street closures and truck routes may need to be established to access the construction site. Coordination of multiple trucks may be necessary for large pours and may require special access and scheduling. The contractor may elect to create an on-site ready-mix plant to supply the concrete if there is ample on-site space and the nearest concrete plant is far away.

Before the concrete could be poured, all necessary reinforcement and concrete forms would need to be in place. The reinforcement would be delivered on large flatbed trucks and would be stored on site in bundles. The formwork could consist of large steel panels or plywood that holds the wet concrete in place. The formwork would be braced or temporarily supported to maintain the weight of the concrete until it cured.

The truck would then be positioned at the location required for the pour. If the truck could not access the location of the pour, the concrete would need to be placed by pump, conveyer system, or similar measures. It may need curing for a week before forms could be removed.

5.5.8 Structural Steel Erection

The proposed improvements would require standard steel erection to assemble the structures. Structural steel could consist of plates, angles, girders, beams, cross frames, deck plates, rails, or similar. The steel could vary in size, length, weight, and use.

The steel members would be delivered to the site on large flatbed trucks or semi-trucks and could require special hauling permits. The construction zone would require special access areas so that the steel could be delivered, assembled on site, stored, or moved into position. Cranes would be used to pick the pieces off the trucks, move the material overhead and place them into position.

5.5.9 Methods for Protecting Utilities and Adjacent Structures

Methods for protecting nearby utilities and adjacent structures would include standard industry practice techniques. These techniques include coordinating with existing utilities and field verifying locations. The Office of Underground Coordination requires a review of foundations that are within two feet of the property line. Dig requests must be submitted to Chicago DIGGER (Chicago Utility Alert Network) for areas within the limits of the City of Chicago and Joint Utility Locating Information for Excavators (JULIE) for areas outside the City of Chicago limits before any excavation can begin.

Section 6
Impacts and Mitigations

This section summarizes the potential construction impacts for each of the build alternatives, as well as the general mitigation measures. All RLE alternatives are analyzed in this memorandum; however, the No Build Alternative does not involve any construction activities, therefore, no construction impacts would occur, and no further discussion of the No Build Alternative is included here.

6.1 Land Use and Economic Development

The following is a summary of construction impacts described in the *Land Use and Economic Development Technical Memorandum*. The impact findings are highlighted here, while detailed information on potential mitigation may be found in the resource-specific technical memorandum. The API for the land use and economic development evaluation includes parcels directly adjacent to project alternative centerlines and the area within a ½-mile radius of stations.

6.1.1 Bus Rapid Transit Alternative

There would be isolated disruptions to business and residential access during construction at parcels directly adjacent to the proposed bus stops and park & ride lots. Due to the isolated site improvements and short construction timeframe, the construction impacts of the BRT Alternative would be considered not substantially adverse on existing land uses. Due to construction jobs creation (refer to the *Land Use and Economic Development Technical Memorandum* for an estimate of the number of short-term jobs), the construction impacts of the BRT Alternative would be considered beneficial for economic development.

6.1.2 Union Pacific Railroad Rail Alternative

The potential construction impacts and mitigation would be similar for the UPRR Rail Alternative options. For the 120th Street yard and shop, the CTA would coordinate construction activities with the MWRD to avoid conflicts with utility operations.

Construction would take up to 5 years and would cause temporary impacts on adjacent residential neighborhoods due to noise, fugitive dust, truck traffic, and roadway detours. Mitigation methods would include daytime construction and soundproofing for sensitive resources, if necessary. Based on mitigation and the beneficial impacts of the project, the land use impacts from construction would be considered not substantially adverse.

Construction would cause temporary impacts on adjacent commercial uses on Michigan Avenue due to noise, fugitive dust, truck traffic, and roadway detours. Mitigation would include daytime construction, commercial signage during detours, and special advertising for businesses within the ½-mile API. There would be short-term beneficial impacts from construction jobs. It is estimated that during mobilization and peak construction, up to 2,660 full-time staff (per the *Land Use and Economic Development Technical Memorandum*) would be devoted to construction of the UPRR Rail Alternative. Based on mitigation and the beneficial impacts of the project, the overall economic development impact from construction of the UPRR Rail Alternative would be considered beneficial.

6.1.3 Halsted Rail Alternative

Construction would take up to 5 years and would cause temporary impacts on residential areas on or adjacent to Halsted Street due to noise, fugitive dust, truck traffic, and roadway detours. Mitigation methods would include daytime construction and soundproofing for sensitive resources, if necessary. Based on mitigation and the beneficial impacts of the project, the land use impacts from construction would be considered not substantially adverse.

Construction would cause temporary impacts on commercial uses along Halsted Street due to noise, fugitive dust, truck traffic, and roadway detours. Construction activities would occur throughout the Halsted Street corridor within the median and adjacent travel lane, and would affect travel lane patterns and on-street parking. Due to the nature and size of the businesses along Halsted Street, some small businesses may not be able to maintain their customer base and may lose business from construction-related disruptions. Mitigation methods would include daytime construction, commercial signage during detours, and special advertising for businesses within the ½-mile API. As it would be for the UPRR Rail Alternative, it is estimated that up to 2,660 full-time staff (per the *Land Use and Economic Development Technical Memorandum*) would be devoted to construction of the Halsted Rail Alternative. Based on mitigation and the beneficial impacts of the project, the overall economic development impact from construction of the Halsted Rail Alternative would be considered beneficial.

6.2 Displacements and Relocation of Existing Uses

There would be no displacement or relocation impacts associated with the construction phase for the build alternatives. Each of the proposed alternatives requiring permanent ROW would result in land acquisitions and displacements. The BRT Alternative would affect 52 parcels and 3 buildings. The UPRR Rail Alternative ROW Option would affect 133 parcels and 24 buildings. The UPRR Rail Alternative East Option would affect 256 parcels and 112 buildings. The UPRR Rail Alternative West Option would affect 193 parcels and 53 buildings. The Halsted Rail Alternative would affect 108 parcels and 38 buildings. Please refer to the *Displacements and Relocation of Existing Uses Technical Memorandum* for additional information on displacements and relocations. Temporary construction easements would not result in displacements or relocations.

6.3 Neighborhoods and Community Impacts

The following is a summary of construction impacts described in the *Neighborhood and Community Impacts Technical Memorandum*. The impact findings are highlighted here, while detailed information on potential mitigation may be found in the resource-specific technical memorandum. The API includes the neighborhood and community areas within approximately ½ mile of the proposed build alternative alignments. Accordingly, the affected environment includes the Village of Calumet Park and the Chicago neighborhoods of Washington Heights, Roseland, Morgan Park, West Pullman, Pullman, and Riverdale.

6.3.1 Bus Rapid Transit Alternative

Construction of the BRT Alternative would involve placement of new bus shelters, lighting, park & ride facilities, crosswalks, sidewalk improvements, ramps, traffic signals, and transit signal priority infrastructure along the proposed route. Work would occur largely within the street; however, some off-street staging on adjacent publicly owned and vacant lots may occur through the establishment of temporary construction easements. Some temporary road closures would be needed, and would be scheduled at night and other low-traffic times to the extent practicable and per IDOT and/or CDOT approval.

The parking structure at the Kensington Avenue stop would require more intensive construction, but would be phased to minimize disruption. Temporary dust, noise, and visual impacts would occur, as well as minor intermittent traffic delays near the construction site. Adjacent residents would experience these temporary impacts during construction, but impacts on the West Pullman community would be mitigated through best management practices.

6.3.2 Union Pacific Railroad Rail Alternative - Right-of-Way Option

Community disruption would occur during construction for the UPRR Rail Alternative. The 120th Street yard and shop would be located far enough from established communities such that no construction impacts would occur.

Most of the construction activities and staging would occur within street ROW, properties acquired as part of the project's permanent envelope, and potentially other nearby vacant parcels through the establishment of temporary construction easements. Increased truck traffic to and from the alignment would also occur. Hoisting equipment may be visible above the roofs of existing buildings. Storage of materials, equipment, and trucks would introduce visual impacts within communities, but these impacts would not be adverse given their temporary nature and CTA's use of best management practices. CTA would notify the community in advance of disruptive activities such as building demolition, utility relocation, and necessary detours, and would perform work in a manner consistent with local ordinances. Hauling routes would be designed to minimize truck traffic and equipment passing through sensitive areas of the community, and would favor highways to the extent feasible. There is ample street capacity and land available for construction staging in the project area. While specific construction routes have not been finalized for the project, it is anticipated that impacts would either be avoided or readily mitigated. This conclusion will be confirmed after designation of a NEPA Preferred Alternative and completion of a detailed construction management plan including routing.

Temporary dust, noise, and visual impacts would occur. Residents would experience these impacts during construction on an intermittent basis, but impacts on the Washington Heights, Roseland, and West Pullman communities would not be adverse through the use of best management practices. The Michigan Avenue station would require more intensive construction activities due to the multi-level parking structure, but construction would be phased to reduce impacts. Construction activities at any one location along the alignment would not last for the entire duration of the project construction phase.

During construction of the UPRR Rail Alternative, streets crossing the proposed alignment may require temporary closure. Detours would be provided to maintain access to adjacent properties, and bus transit service would detour around closures. Temporary traffic pattern changes, such as full street closure, converting a two-way street to one-way operation, or reducing the number of available travel lanes, may also be needed. Temporary parking restrictions may also be implemented to facilitate construction activities.

Businesses around the alignment and parking structure could be affected by construction activities, construction-related traffic, and road and sidewalk closures. Temporary roadway delays due to truck traffic and construction equipment would occur. The CTA would provide adequate detours and minimize road closures to the extent practicable, but some adverse impacts on businesses may occur, as people may avoid the area altogether. These potentially adverse impacts would be mitigated through early notification of construction activities, provision of temporary alternate access routes, and advertising programs to increase the visibility of affected businesses.

Public schools, public libraries, senior living centers, hospitals, daycare centers, and other public facilities near the proposed 130th Street station (both options) would be subject to temporary adverse impacts associated with potential traffic detours; however, access would be maintained throughout the duration of the project.

6.3.3 Union Pacific Railroad Rail Alternative - East Option

With the East Option, construction impacts and mitigation for affected neighborhoods would be similar to those of the ROW Option. A greater intensity of construction activities is anticipated for the East Option than for the ROW Option, because more building demolition would be required. The East Option would require the greatest number of building acquisitions of the three UPRR Rail Alternative options.

6.3.4 Union Pacific Railroad Rail Alternative - West Option

With the West Option, construction impacts and mitigation for affected neighborhoods would be similar to those of the ROW Option. A greater intensity of construction activities is anticipated for the West Option than for the ROW Option, because more building demolition would be required. The West Option would require fewer building acquisitions overall than the East Option.

6.3.5 Halsted Rail Alternative

Community disruption would occur during construction for the Halsted Rail Alternative. Construction activities would be more disruptive than under the UPRR Rail Alternative because the Halsted Rail Alternative elevated structure would be built in the median of a major commercial street instead of on private off-street ROW.

Most of the construction activities and staging would occur within street ROW, properties acquired as part of the project’s permanent envelope, and potentially other nearby vacant parcels through the establishment of temporary construction easements. Increased truck traffic to and from the alignment would also occur, particularly on Halsted Street and major east-west cross streets. Hoisting equipment would be visible above the roofs of existing buildings and in staging areas. Storage of materials, equipment, and trucks would introduce visual impacts within communities, but these impacts would not be adverse given their temporary nature and CTA's use of best management practices. CTA would notify the community in advance of disruptive activities such as building demolition, utility relocation, pile driving, caisson driving, and necessary traffic detours, and would perform work in a manner consistent with local ordinances. Hauling routes would be designed to minimize the number of trucks and equipment passing through sensitive areas of the community, and would favor highways to the extent feasible.

Temporary dust, noise, and visual impacts would occur. Residents would experience these impacts during construction on an intermittent basis, but with the application of best management practices, impacts would not be adverse.

During construction of the Halsted Rail Alternative, Halsted Streets and its east-west cross streets would require temporary, intermittent roadway and lane closures. Detours would be provided to maintain access to adjacent properties, and bus transit service would detour around closures. Temporary traffic pattern changes may also be needed such as full street closure, converting a two-way street to one-way operation, or reducing the number of available travel lanes. Temporary parking restrictions may also be implemented to facilitate construction activities.

Businesses around the alignment and parking structure would be affected by construction activities, construction-related traffic, and road and sidewalk closures. Temporary roadway delays due to truck traffic and construction equipment would occur. The CTA would provide adequate detours and minimize road closures to the extent practicable, but some adverse impacts on businesses may occur, as people may avoid the area altogether. This potentially adverse impact would be mitigated through early notification of construction activities, provision of temporary alternate access routes, and advertising programs to increase the visibility of affected businesses.

The Vermont Avenue station would require more intensive construction activities due to the multi-level parking structure, but construction would be phased to reduce impacts. Construction activities at any one location along the alignment would not last for the entire duration of the project construction phase.

6.4 Parklands and Community Facilities

The following is a summary of construction impacts described in the *Parklands and Community Facilities Technical Memorandum*. The impact findings are highlighted here, while detailed information on potential mitigation may be found in the resource-specific technical memorandum. The API includes parklands within 500 feet of an alternative's ROW and within ½ mile around the proposed stations/stops, and community facilities within or adjacent to the permanent ROW of an alternative and within ½ mile around the proposed stations/stops.

6.4.1 Bus Rapid Transit Alternative

Golden Gate Park would be subject to temporary impacts during the construction of the parking garage at the 130th Street stop because of its location within 500 feet of construction activities. The temporary impacts would include noise impacts from construction equipment, air quality impacts from fugitive dust and/or an increase in vehicle activity, and temporary reduction in access to the park due to construction detours. After mitigation, there would be no adverse impacts on Golden Gate Park from construction. Mitigation would include the following:

- Construction BMP, including but not limited to no idling of vehicles to reduce emissions, watering disturbed ground surfaces to reduce fugitive dust, and performing heavy construction activities during off-peak times.
- Coordination with the Chicago Park District in order to inform park users of construction activities and detour routes, provide alternate parking if necessary, or temporarily relocate park activities to another park if necessary.

Rose Haven Manor Senior Housing (at the 102nd Street stop), New Testament Baptist Church (at the 111th Street stop), and Aldridge Elementary School (at the 130th Street stop) are community facilities that would be subject to temporary construction impacts such as noise impacts and temporary changes to traffic flow and/or parking. Mitigation would include construction BMP, detour routes through the construction area, and alternative parking provisions. After mitigation, there would be no adverse impacts on community facilities from construction activities.

6.4.2 Union Pacific Railroad Rail Alternative - Right-of-Way Option

Construction activities would occur in the northwest corner of Wendell Smith Park. Depending on the timing and schedule, construction would interfere with organized activities that occur in Wendell Smith Park. Construction activities would generate temporary noise and air quality impacts, and interrupt access and parking around the park. Construction activities would not interfere with the use of Fernwood Parkway or Block Park; however, access to these parklands could be temporarily altered while the structure, station and parking facilities at the 103rd Street station are under construction. After mitigation, the construction impacts would be considered not adverse.

Construction activities at the Michigan Avenue station would temporarily affect New Christian Joy Missionary Baptist Church with construction noise and temporary changes in access and available parking. Mitigation would involve construction BMP and the provision of information about construction schedules and changes in parking and/or detours to the church. After mitigation, construction impacts on this church would be considered not adverse.

Construction activities at cross streets along the UPRR corridor could temporarily reduce accessibility of the roadway network and cause delays for emergency service providers. Construction activities would be coordinated with the Chicago Office of Emergency Management and Communications (OEMC). In particular, the construction plans for the 103rd Street station would be coordinated with the adjacent Chicago Fire Department - Engine Co. 93, and the construction plans for the 111th Street station would be coordinated with Roseland Community Hospital. After mitigation, the construction impacts on emergency responders would be considered not adverse.

Construction activities would temporarily affect Kensington Park, which is within 500 feet of the construction activities that would occur between Prairie Avenue and CN/ME tracks. Because of the street configuration, construction vehicles would need access to the project via the Kensington Park parking lot at 118th Street. Impacts would include temporary noise and air quality impacts and reduced parking. Construction activities for the 130th Street South Station Option would temporarily affect the park entrance of the Beaubien Woods Nature Preserve on Doty Avenue. Any temporary change in access would be mitigated through coordination with the Forest Preserve District of Cook County. After mitigation, the construction impacts would be considered not adverse.

120th Street Yard and Shop There are no parklands or community facilities near the 120th Street yard and shop location; therefore, no impacts would result from the construction activities.

6.4.3 Union Pacific Railroad Rail Alternative - East Option

The East Option would have similar construction impacts on Wendell Smith Park as the ROW Option; however, a larger geographic area would be affected. After mitigation, the construction impacts would be considered not adverse.

Construction activities for the East Option would occur in the western parcel of Block Park within the proposed permanent envelope. The western parcel would be inaccessible during construction. Construction impacts from noise, air quality, and changes in access would be temporary and would be not substantially adverse because Block Park does not serve a recreational use, construction activities would not interfere with its current use, and the park is currently subject to noise from the adjacent UPRR freight rail traffic. After mitigation, the construction impacts would be considered not adverse.

Construction of the East Option would have the same impacts and mitigation for Fernwood Parkway as those described for the ROW Option. After mitigation, the impacts on Fernwood Parkway would be considered not adverse.

Construction of the East Option would affect the same community facility and emergency service providers identified for the ROW Option; therefore, the same mitigation would be used for the impacts of the East Option. After mitigation, the impacts on community facilities and emergency service providers would be considered not adverse.

The construction impacts on parklands discussed for the ROW Option would be the same for the East Option; therefore, the same mitigation would be used. After mitigation, the construction impacts would be considered not adverse.

The construction impacts on community facilities discussed for the ROW Option would be the same for the East Option; therefore, the same mitigation would be used. After mitigation, the construction impacts would be considered not adverse.

6.4.4 Union Pacific Railroad Rail Alternative - West Option

The construction impacts of the West Option on Wendell Smith Park would be the same as those described for the ROW Option, but the amount of parkland affected by construction would be smaller. The mitigation described for the ROW Option would be the same for the West Option. After mitigation, the construction impacts would be considered not adverse.

Construction activities would occur within Fernwood Parkway; this park is narrow and the proposed permanent envelope of the West Option would pass through the center of the park. The park would not be accessible during construction. The construction impacts would be considered not substantially adverse, because the park does not offer recreational amenities or activities and is largely underutilized. After mitigation, the construction impacts would be considered not adverse.

Construction of the West Option would affect the same community facility and emergency service providers identified for the East and ROW Options; therefore, the same mitigation would be used for the impacts of the West Option. After mitigation, the impacts on community facilities and emergency service providers would be considered not adverse.

The construction impacts on parklands discussed for the ROW and East Options would be the same for the West Option; therefore, the same mitigation would be used. After mitigation, the construction impacts would be considered not adverse.

The construction impacts on community facilities discussed for the ROW and East Options would be the same for the West Option; therefore, the same mitigation would be used. After mitigation, the construction impacts would be considered not adverse.

6.4.5 Halsted Rail Alternative

There are no parklands within 500 feet of the proposed ROW for the Halsted Rail Alternative, but construction activities for the Halsted Rail Alternative would occur near Major Taylor Bike Trail. The impacts on the trail would be the temporary rerouting of pedestrian and bicycle traffic across the 119th Street and Halsted Street intersection during construction. The mitigation would include communicating access changes to trail users and the Friends of Major Taylor Bike Trail and providing alternative routes for pedestrians and bicycle to cross the streets. After mitigation, the impacts on Major Taylor Bike Trail would be considered not adverse.

Construction activities would temporarily affect vehicle and pedestrian access to community facilities on and near Halsted Street; however, clear signage, detour routes, and alternate parking would be provided as mitigation. Construction would also result in temporary noise impacts for community facilities on Halsted Street. While construction noise is unpleasant, it is temporary and would not interfere with any community facility's ability to provide service. Construction BMP would be implemented to mitigate noise impacts. Lastly, construction would generate fugitive dust and other air quality impacts from construction vehicles. Due to sensitive populations, adjacent schools and senior centers would be more sensitive to temporary air quality impacts. Construction BMP to capture dust and minimize idling construction vehicles would be used to mitigate these impacts. After mitigation, the impacts on community facilities would be considered not adverse.

Construction activities would temporarily reduce accessibility of the roadway network, which could cause delays for emergency service providers. The same mitigation described for the UPRR Rail Alternative would be used to inform the OEMC and the Chicago Fire Department - Engine Co. 115. After mitigation, the impacts on emergency service providers would be considered not adverse.

119th Street Yard and Shop - There are no parklands within 500 feet of the proposed ROW for the 119th Street yard; however, construction of the 119th Street yard and shop would affect the Chicago Fire Department - Engine Co. 115 and Mt. Zion First Holy Miracle Church. After mitigation, the impacts on this emergency service provider and community facility would be considered not adverse.

6.5 Visual and Aesthetic Conditions

The following is a summary of construction impacts described in the *Visual and Aesthetic Conditions Technical Memorandum*. The impact findings are highlighted here, while detailed information on potential mitigation may be found in the resource-specific technical memorandum. The API includes all areas along the alternative corridors within visual range of pedestrians, but would depend on the existence of view corridors. View corridors, including parks and streets, can increase the API. View corridors perpendicular to the project area are assumed to be ¼ mile.

6.5.1 Bus Rapid Transit Alternative

There would be minimal construction impacts on the existing visual condition along the BRT Alternative route. The visual impacts would be temporary, lasting several weeks to a year, and would relate primarily to parking facilities. Visual impacts may include construction fencing, demolition of existing buildings or clearing of vacant lots, temporary street closures and related signage, and temporary lighting or entrances. During construction, BMP and debris-free construction areas would mitigate temporary visual impacts from the construction sites; therefore, the temporary visual impacts would be considered not adverse.

6.5.2 Union Pacific Railroad Rail Alternative

Construction impacts and mitigations would be similar in nature for all UPRR Rail Alternative options. The 120th yard and shop would be located within an industrial land use area, far enough from established communities such that no construction impacts would occur.

The construction impacts from the UPRR Rail Alternative would be more extensive on the existing visual condition than those of the BRT Alternative. The visual impacts would be temporary, lasting several months to a few years depending on the alignment location and occurrence of station facilities and parking. Visual impacts may include construction fencing, demolition of existing buildings, temporary walls, temporary street closures and related signage, temporary lighting, temporary entrances, and shoring of concrete structures or existing viaducts during construction. During construction, BMP and debris-free construction areas would mitigate temporary visual impacts from the construction sites; therefore, the temporary visual impacts would be considered not adverse after mitigation.

6.5.3 Halsted Rail Alternative

Construction impacts and mitigations would be the same as those described for the UPRR Rail Alternative. Additional road construction impacts would be created for the removal of trees within the median planters and replacement with hammerhead piers. Temporary visual impacts would be considered not adverse after mitigation.

6.6 Noise and Vibration

The following is a summary of construction impacts described in the *Noise and Vibration Technical Memorandum*. The impact findings are highlighted here, while detailed information on potential mitigation may be found in the resource-specific technical memorandum. A general assessment was conducted to determine the location of areas that could have a moderate or severe impact along the proposed corridors. This assessment established an impact contour (defining the outer limit of an impact corridor) because there are numerous existing noise-sensitive receptors along the entire length of the project corridor.

6.6.1 Bus Rapid Transit Alternative

Construction noise from the BRT Alternative would result from minor construction activity at the bus stop areas and parking facilities. Construction noise levels are not expected to exceed the FTA construction noise limits; therefore, the impacts would be considered not adverse.

6.6.2 Union Pacific Railroad Rail Alternative

The UPRR Rail Alternative options would include the construction of an aerial structure, stations, and parking facilities. There would be the potential for construction impacts and mitigation in residential areas and the 120th Street yard and shop. Typical construction equipment could include excavators, front-end loaders, cranes, drilling rigs, compressors, and trucks depending on the type of construction work required. The FTA construction noise impact assessment is based on the cumulative noise level from the two loudest pieces of equipment that, under worst-case conditions, would operate continuously at full power over a period of 1 hour. From the list of construction equipment in the FTA guidance manual, the two noisiest pieces of equipment would be the excavator (85 dBA at a distance of 50 feet) and truck (88 dBA at a distance of 50 feet). The combined noise level from these two pieces of equipment would be 90 dBA at a distance of 50 feet. Using the recommended FTA construction noise limits, any construction activity that occurred within 50 feet of a residential receptor would result in a noise impact during daytime hours. For commercial and industrial areas, the FTA daytime construction noise impact criterion is 100 dBA.

Construction noise levels are not expected to exceed the FTA recommended construction noise limits; therefore, construction noise mitigation measures are not required. Nevertheless, CTA would limit nighttime construction near residences to the extent practicable. All construction equipment exhaust mufflers would be kept in a state of good repair. To the maximum extent possible, vehicles that are not in use would not remain idling on the construction site. As a result of these BMPs, the impacts would be considered not adverse.

6.6.3 Halsted Rail Alternative

Construction impacts from the Halsted Rail Alternative and the 119th Street yard and shop would be the same as those described for the UPRR Rail Alternative.

6.7 Safety and Security

The following is a summary of construction impacts described in the *Safety and Security Technical Memorandum*. The impact findings are highlighted here, while detailed information on potential mitigation may be found in the resource-specific technical memorandum. The API for the safety and security evaluation includes a ½-mile radius centered on each of the proposed station and stop locations as well as the existing 95th Street Terminal. One-half mile is an approximation of the distance most patrons would walk to a station and is used to measure general pedestrian safety and security in the surrounding neighborhood.

6.7.1 Bus Rapid Transit Alternative

The BRT Alternative would primarily involve the construction of bus shelters, sidewalks, and parking facilities. While there is always a chance that a contractor could fail to follow all safety and security rules, the limited scope of work is likely to minimize the risk of incidents resulting in fatalities, injuries, or criminal acts such as vandalism or theft on construction sites.

6.7.2 Union Pacific Railroad Rail Alternative - Right-of-Way Option

The extensive scope of work for this alternative would create a need for a large number of contractors in many areas over a long time period. To mitigate risks of safety and security incidents, contractors would be expected to develop a Construction Safety and Security Plan, perform job safety analysis, monitor safety and security activities, and comply with any other relevant aspects of the CTA's *Safety and Security Management Plan* (CTA 2011b) or other manuals and policies.

Road closures and detours during construction would affect emergency services. Emergency services would be able to access construction sites at all times in the same way contractors access the sites. Emergency service providers crossing the tracks would have to use recommended detours, just as with any roadway construction project. As mitigation, neither adjacent roadways nor adjacent through streets operating in the same direction would be closed simultaneously. Emergency services would be able to access construction sites at all times in the same way contractors access the sites. An access road for the MWRD would be constructed prior to the new CTA tracks if necessary to maintain access to the MWRD facility. This roadway could also be used by emergency services. The impacts would be not substantially adverse. The 120th Street yard and shop would be within the same area, and the impacts would not be adverse.

As mitigation, traffic management plans would be created during the final engineering phase of the project to identify detour and emergency access routes, which would generally follow the nearest arterial or collector streets. Contractors would also follow the *Manual on Uniform Traffic*

*Control Devices (*FHWA 2009*)* design standards for temporary traffic control and would obtain all required local permits.

6.7.3 Halsted Rail Alternative

The extensive scope of work for this alternative would create a need for a large number of contractors in many areas over a long time period. To mitigate risks of safety and security incidents, contractors would be expected to develop a Construction Safety and Security Plan, perform job safety analysis, monitor safety and security activities, and comply with any other relevant aspects of the CTA's Safety and Security Management Plan an or other manuals and policies (CTA 2011b).

Construction work would be phased to minimize traffic impacts on Halsted Street and adjoining streets; however, elevated structure construction would require lane and street closures and superstructure erection would require temporary shutdown of all traffic along portions of Halsted Street. In order to maintain emergency access on cross-streets, only short segments of Halsted Street (less than ½ mile long) would be closed at any given time. Emergency services would need to access construction sites in the same way as contractors, by using various side streets and recommended detours. The impacts would be not substantially adverse. Mitigation would be the same as that described for the UPRR Rail Alternative.

6.8 Historic and Cultural Resources

The following is a summary of construction effects described in the *Historic and Cultural Resources Technical Memorandum*. Effects would be confirmed and considered within the Section 106 process as the preferred alternative selection and design progresses. The area of potential effect (APE) for the RLE Project was delineated considering the location of the proposed alternatives; the potential for ground disturbance, destruction, or property taking; locations from which the undertaking may be visible and/or audible; and the scale and setting of the project. Generally, the APE contains those parcels within a block of the centerlines for the UPRR and Halsted Rail Alternatives, and widens to accommodate the locations of park & ride facilities and a proposed rail yard. The APE for the BRT Alternative includes the area immediately surrounding the park & ride and parking garage locations.

6.8.1 Bus Rapid Transit Alternative

Two resources near the BRT corridor have been identified as eligible for the National Register of Historic Places (NRHP): the Venetian Hall at 133-139 E. Kensington Avenue and the Altgeld Gardens Housing Project at 927 E. 131 Street. While construction activities would likely be perceptible at the Venetian Hall, it is not anticipated to adversely affect the characteristics that qualify the resource for inclusion on the NRHP. Visual, noise, vibration, and construction effects are not anticipated to affect the characteristics that qualify Altgeld Gardens Housing Project for inclusion on the NRHP.

6.8.2 Union Pacific Railroad Rail Alternative

The effects would be similar in nature for all UPRR Rail Alternative Options and for the 120th Street yard and shop. Six resources near the UPRR corridor have been identified as NRHP eligible:

the eclectic neo-traditional residence at 444 W. 100th Place, the fire station at 324 W. 104th Street, the Roseland Pumping Station at 351 W. 104th Street, the Romanesque revival church at 10920 S. Princeton Avenue, the Venetian Hall at 133-139 E. Kensington Avenue, and the Altgeld Gardens Housing Project. Visual, noise, vibration, and construction effects are not anticipated to affect the characteristics that qualify these six resources for inclusion on the NRHP. Given that the Roseland Pumping Station is within 50 feet of the alignment, a barrier wall could be constructed for protection of this resource.

6.8.3 Halsted Rail Alternative

Based on preliminary analysis, the Halsted Rail Alternative would result in adverse effects on four historic resources: the Classical Revival CTA substation at 10227 S. Halsted Street, S.S. Peter & Paul Catholic Church at 12433 - 12439 S. Halsted Street, the fire station (Engine Co. 115) at 11940 S. Peoria Street, and the Cedar Park Cemetery gatehouse/entryway at 12540 S. Halsted Street. Although none of these structures would be physically demolished, the scale and proximity of the construction activities are anticipated to have an adverse effect on the characteristics that qualify each resource eligible for NRHP listing. None of the other alternatives are anticipated to result in adverse effects on other historic resources. Please refer to the Permanent Impacts section of the *Historic and Cultural Resources Technical Memorandum*.

6.9 Hazardous Materials

The following is a summary of construction impacts described in the *Hazardous Materials Technical Memorandum*. More detailed information on potential hazardous sites and mitigation may be found in the resource-specific technical memorandum. The API for the hazardous materials evaluation extends out to ¼ mile from the project limits. Approximate soil/hazardous material removal quantities presented in this section were based on the horizontal and vertical extent of the excavation required for the alternative and the extent of the identified contamination from historical records. The quantities presented in each of the descriptions are estimates and would require field verification during construction activities.

6.9.1 Bus Rapid Transit Alternative

Subsurface excavation associated with the BRT Alternative would occur during construction of proposed parking facilities for the 103rd Street, 111th Street, Kensington Avenue and 130th Street bus stops. Construction of this alternative would result in generation of a large quantity of soil that could contain contaminated materials requiring off-site disposal.

One “High Concern” site was identified near the proposed 130th Street park & ride location and is an operating wastewater treatment plant. Sludge, a byproduct of the wastewater treatment process, typically contains heavy metals and other contaminants and may be present throughout the site, including within the footprint of the proposed park & ride facility at 130th Street.

Construction of park & ride facilities at 103rd Street and Kensington Avenue would include demolition of existing structures that were likely constructed before 1978–1979. These structures potentially contain asbestos-containing material and lead-based paint that could result in a release of asbestos fibers and lead dust during construction. Hazardous materials typically involved with construction activities, such as paints, solvents, fuels and hydraulic fluids, could also be accidentally released during construction.

Numerous mitigation measures for the BRT Alternative would be used to avoid and minimize impacts prior and during construction. In addition, a Phase I Environmental Site Assessment (ESA) of any property to be purchased would be conducted as part of the Final EIS to identify recognized environmental conditions and assess and limit environmental liability. Based on the Phase I ESA findings, a Phase II ESA could also be required during the property acquisition phase and prior to purchasing a property. After mitigation, the construction impacts would be considered not adverse.

6.9.2 Union Pacific Railroad Rail Alternative - Right-of-Way Option

The UPRR ROW Option would require approximately 270,200 cubic yards of soil or aggregate excavation, and there would be the potential to encounter hazardous materials. The ROW Option would also include construction within the UPRR corridor, which is potentially impacted from the use of fuel, oil, paints, herbicides and pesticides, creosote, polynuclear aromatic hydrocarbons and coal ash associated with the long-term operation as a railroad. If groundwater is encountered during construction, there is the potential that it may contain hazardous materials as well. The ROW Option also would include the demolition of existing structures that were likely constructed before 1978–1979. These structures potentially contain asbestos-containing material and lead-based paint that could result in a release of asbestos fibers and lead dust during construction.

The ROW contains one “High Concern” site within the proposed permanent envelope. Three additional “High Concern” sites would be within the 120th Street Yard and Shop.

The ROW would potentially include two Comprehensive Environmental Response, Compensation and Liability Information System (CERCLIS)-Archived sites within the permanent envelope. The CERCLIS sites come with increased risk of the United States Environmental Protection Agency (USEPA) imposing liability and remediation obligations on potentially responsible parties. These sites have Archived status, which means USEPA has completed its assessment of the site and has determined that no future action would be taken to list it on the National Priorities List and removed it from their inventory of Superfund sites. This does not, however, mean that a site is considered clean, and additional caution would be taken before acquiring ownership. Construction of the 120th Street yard and shop would require approximately 138,100 cubic yards of soil or aggregate excavation, some of which would be associated with two hazardous material sites: the Keywell site at 11900 Cottage Grove Avenue and the Penn Central Corp./Lake Calumet Quad at 810 E. 124th Street. There would therefore be the potential to encounter hazardous materials, whether from the sites identified or from the presence of urban fill. For additional information for these sites, please refer to the *Hazardous Materials Technical Memorandum*, May 22, 2013.

Proposed mitigation measures for construction impacts on hazardous materials would be similar to those of the BRT Alternative, including Phase I ESA and Phase II ESA of any properties needed for the proposed permanent envelope. After mitigation, the construction impacts would be considered not adverse.

6.9.3 Union Pacific Railroad Rail Alternative - East Option

The UPRR East Option would require approximately 122,900 cubic yards of soil or aggregate excavation. Construction impacts and mitigation would be similar to those under the UPRR ROW Option. The East Option would include three “High Concern” sites within its permanent envelope. Three additional “High Concern” sites would be within the 120th Street Yard and Shop. Construction impacts and mitigation for the 120th Street yard and shop would be similar to those for the UPRR ROW Option.

6.9.4 Union Pacific Railroad Rail Alternative - West Option

The UPRR West Option would require approximately 129,400 cubic yards of soil or aggregate excavation. Construction impacts and mitigation would be similar to those under the UPRR ROW Option. The West Option would include three “High Concern” sites within its permanent envelope. Three additional “High Concern” sites would be within the 120th Street Yard and Shop. Construction impacts and mitigation for the 120th Street yard and shop would be similar to those for the UPRR ROW Option.

6.9.5 Halsted Rail Alternative

The Halsted Rail Alternative would require approximately 141,300 cubic yards of soil or aggregate excavation, and there would be the potential to encounter hazardous materials. If groundwater is encountered during construction, it may contain hazardous materials as well. Construction of the Halsted Alternative would include the demolition of existing structures that were likely constructed before 1978–1979. These structures potentially contain asbestos-containing material and lead-based paint that could result in a release of asbestos fibers and lead dust during construction. Hazardous materials typically involved with construction activities, such as paints, solvents, fuels and hydraulic fluids, could also be accidentally released during construction.

Construction of the 119th Street yard and shop would require approximately 129,100 cubic yards of soil or aggregate excavation, and there would be the potential to encounter hazardous materials. Six “High Concern” sites are within the permanent envelope of the 120th Street yard and shop. One CERCLIS site (Ingersoll Industrial Site at 1000 W. 120th Street) and one CERCLIS-No Further Remediation Planned site are within the permanent envelope. There is also an active CERCLIS site (Dutch Boy Paint Site at 1200 Peoria Avenue) adjacent to the 119th Street yard and shop location, and it has the potential for offsite migration of contamination.

Construction of the 119th Street yard and shop would include the demolition of existing structures that were constructed before 1978–1979. These structures potentially contain asbestos-containing material and lead-based paint that could result in a release of asbestos fibers and lead dust during construction. Hazardous materials typically involved with construction activities, such as paints, solvents, fuels and hydraulic fluids, could also be accidentally released during construction.

Proposed mitigation measures for construction impacts on hazardous materials would be similar to those of the BRT Alternative, including Phase I ESA and Phase II ESA of any properties needed for the proposed permanent envelope. After mitigation, the construction impacts would be considered not adverse.

6.10 Air Quality

The following is a summary of construction impacts described in the *Air Quality Technical Memorandum*. More detailed information on potential air quality impacts and mitigation may be found in the resource-specific technical memorandum. The API for air quality has both a regional and a local component. The regional component follows the analysis area adopted by the traffic analysis, which is a corridor bounded on the south by a varying boundary that includes 134th Street, on the north by 91st Street, on the west by a varying boundary that includes Halsted Street, and on the east by a varying boundary that includes I-94. The local component would be limited to the individual stations, their associated parking facilities, and nearby intersections affected by traffic entering and exiting the stations.

The air quality impacts from construction would be similar in nature for all build alternatives, as well as their respective segments, the 120th Street yard and shop, and the 119th Street yard and shop; however, the schedule for construction activities would be longer for the UPRR Rail Alternative and the Halsted Rail Alternative than with the BRT Alternative.

Emissions from construction equipment would occur during site preparation activities such as grading, installing curbs, or grubbing and removal of vegetation to prepare a site for construction. Compared with emissions from other motor vehicles sources in the project area, direct emissions from construction equipment and trucks would not likely have the potential to exceed any ambient air quality standards.

Impacts during construction would be primarily associated with fugitive dust and emissions from on-road and non-road vehicles. The equipment producing these emissions would include haul trucks, concrete trucks, front-end loaders, excavators, cranes, drill rigs, compressors, flatbed trucks, and generators. Most state air quality agencies, including Illinois Environmental Protection Agency, have strict guidelines for controlling fugitive dust (usually by good housekeeping practices), diesel particulate emissions (by exhaust emission controls and use of low sulfur fuels), and greenhouse gas emissions (by limiting equipment operations such as excessive idling and by using alternative fuels).

Construction activities would also result in traffic disruption, rerouting, and temporary shutdown of traffic. Traffic disruption, such as decreased roadway capacity or detouring, can lead to increased traffic congestion, thereby increasing motor vehicle exhaust emissions on nearby roadways, and resulting in localized elevated pollutant concentrations. Temporary shutdown of traffic would occur at nighttime and during low-traffic-volume intervals per IDOT and CDOT approval.

Proper traffic management during the construction period would mitigate any potential adverse impacts. Traffic management would include finding less congested routes for construction-related truck traffic, creating temporary detours for regular roadways where capacities were diminished, providing traffic control, routing trucks away from residential neighborhoods, and restricting construction activities during hours of high traffic volumes on the existing roadways. Staging areas and worker parking areas would be established away from sensitive receptors, where possible.

Many state agencies such as IDOT require the contractor to develop a Dust Control Plan that would address in detail how dust would be controlled at all times at the construction site, the staging areas, and the access and egress routes. The agencies also require all diesel-powered equipment and vehicles to be retrofitted with emissions control devices and to use ultra-low sulfur diesel to control diesel particulate emissions.

CTA would require the contractor to develop a plan and schedule to allow construction trucks to access and egress the construction sites and staging areas without excessive disruption and impacts on residences and commercial establishments.

With the use of appropriate mitigation measures as described above, no violations of any of the Illinois or National Ambient Air Quality Standards are anticipated; therefore, no adverse air quality impacts due to construction activities are anticipated.

6.11 Water Resources

The following is a summary of construction impacts described in the *Water Resources Technical Memorandum*. The impact findings are highlighted here, while detailed information on potential mitigation may be found in the resource-specific technical memorandum. The API for the water resources extends 500 feet on either side of the project alternative centerlines. Because the project would occur in a highly urbanized environment, the impacts of construction on water resources would not be expected to extend beyond 500 feet. The affected water resources include stormwater, groundwater, water quality, and wetlands. There are no floodplains in the API.

6.11.1 Bus Rapid Transit Alternative

The physical modifications associated with the BRT Alternative would result in potential impacts on the existing stormwater drainage infrastructure, particularly where park & ride lots and structures would be constructed. These alterations would not greatly affect the direction or volume of drainage through the API.

There would be a potential need for dewatering (by removing groundwater from the construction site by pumping) if groundwater were encountered during construction. Dewatering during construction could temporarily affect local shallow groundwater levels. Given the likelihood of encountering contaminated groundwater, compliance with federal, state, and local laws and regulations would be required during construction.

The impacts from construction of the BRT Alternative on water quality would be minor because the project area is already highly urbanized. In order to ensure that surface water runoff would not have adverse impacts on water quality, human health, or safety, appropriate mitigation measures would be taken to control runoff during implementation.

6.11.2 Union Pacific Railroad Rail Alternative

The potential construction impacts and mitigation would be similar for the UPRR Rail Alternative options and the 120th Street yard and shop. The physical modifications associated with the UPRR Rail Alternative would result in impacts on the existing stormwater drainage infrastructure; however, these alterations would not greatly affect the direction of drainage through the project area and would not change drainage within the watershed. Care would need to be taken during construction in the vicinity of the Roseland Pump Station at 104th Street, as well as the other underground utilities, in order to avoid damaging existing structures.

The impacts from construction of UPRR Rail Alternative on groundwater and water quality would be the same as for the BRT Alternative.

Approximately 27 acres of potential wetlands exist in the vicinity of the UPRR Alternative alignment; however, there would be no temporary construction impacts on wetlands associated with the UPRR Rail Alternative options. Addition information concerning wetlands in the project area is provided in the *Water Resources Technical Memorandum*.

At the 120th Street yard and shop location, physical modifications would result in impacts on the existing stormwater drainage infrastructure; however, these alterations would not greatly affect the direction of drainage through the project area. The potential impacts on groundwater, water quality, and wetlands would be similar to those described under the BRT Alternative.

6.11.3 Halsted Rail Alternative

The physical modifications associated with the Halsted Rail Alternative would result in impacts on the existing stormwater drainage infrastructure; however, these alterations would not greatly affect the direction of drainage through the project area and would not change drainage to the watershed. The potential impacts on groundwater and water quality would be similar to those described under the BRT Alternative. Because there are no wetlands within the API, there would be no construction impacts on wetlands.

At the 119th Street yard and shop location, physical modifications would result in impacts on the existing stormwater drainage infrastructure; however, these alterations would not greatly affect the direction of drainage through the project area and would not change drainage to the watershed. The potential impacts on groundwater and water quality would be similar to those described under the BRT Alternative. Because there are no wetlands at the 119th Street yard and shop site, there would be no construction impacts on wetlands.

6.12 Vegetation and Wildlife Habitat

The following is a summary of construction impacts described in the *Biological Resources Technical Memorandum*. The impact findings are highlighted here, while detailed information on potential mitigation may be found in the resource-specific technical memorandum. For potential impacts on threatened and endangered species, designated critical habitats, vegetation, and other wildlife habitats, the API includes the area within ¼ mile of the proposed alignments, stations, parking facilities, and maintenance yards for each of the project alternatives. Given that the project is in a highly urbanized environment with high existing levels of noise, light, and human activity, the impacts of construction and operation on available habitats and associated wildlife would not be expected to extend beyond ¼ mile.

6.12.1 Bus Rapid Transit Alternative

A small number of trees would likely be removed as a result of park & ride construction activities under the BRT Alternative. Construction impacts under the BRT Alternative would include potential adverse impacts on the following vegetation and wildlife habitat resources:

- The urban tree inventory, due to tree removal. This impact would be reduced to a not adverse level by compliance with local tree protection regulations.
- Migratory birds wherever tree clearing occurs. This impact would be reduced to a not adverse level by the implementation of mitigation measures.

Mitigation measures would be required for compliance with the Migratory Bird Treaty Act and local tree protection ordinances, and to reduce potential impacts on wildlife habitat. Bird species that may utilize those trees that could be removed or disturbed during construction could be affected. Potential mitigation measures would include the following:

- Tree removal would be timed as much as possible to occur outside the migratory bird nesting season, which occurs generally from April 1–September 15 and as early as March 1.
- If construction must occur during the nesting season, two biological surveys would be conducted: one 15 days prior and a second 72 hours prior to the construction that would remove or disturb suitable nesting habitat. If a protected bird were found, surveys would be continued in order to locate any nests. If an active nest were located, construction within 300 feet of the nest would be postponed until the nest is vacated and juveniles have fledged and when there is no evidence of a second attempt at nesting.
- Avoidance measures would be incorporated into the design of the project during preliminary engineering where feasible. If construction of the project requires removal of a protected tree, a permit would be required in accordance with applicable local codes and ordinances of the city in which the affected tree is located. Tree removal permits may require replanting of protected trees within the project area or at another location to mitigate for the removal of these trees. Replanting would be done according to the ratios required by tree removal permits.

6.12.2 Union Pacific Railroad Rail Alternative Options

Trees would likely be removed as a result of construction activities for the UPRR Rail Alternative and the 120th Street yard and shop. Most of the removal would likely occur at the park & ride facilities, and in the median of the interstate just south of the 95th Street Terminal. The potential impacts and mitigation would be similar to those described for the BRT Alternative.

6.12.3 Halsted Rail Alternative

A number of trees would likely be removed as a result of construction activities for the Halsted Rail Alternative and the 119th Street yard and shop. Most of the removal would likely occur from the Halsted Street median and sidewalks. Suitable habitat for listed plant species does not appear to be present in the API. The potential impacts and mitigation would be similar to those described for the BRT Alternative.

6.13 Energy

The proposed alternatives would require energy consumption to support construction activities; however, the approximate quantities used would not be substantial when compared to the annual consumption for Cook County, and would not have an adverse impact on regional energy or fuel supplies. Construction BMP would be implemented to ensure minimization of energy usage.

6.13.1 Bus Rapid Transit Alternative

Energy impacts from construction activities were computed based on typical values for construction categories. Table 6-1 provides a summary for the BRT Alternative. As construction energy use would be a very small fraction of energy use in the region (91 billion British thermal units [BTU] for construction of the BRT Alternative compared to 530 trillion BTU annual energy use in Cook County, or less than 0.02 percent of the Cook County annual energy use), no impact would occur and no mitigation is proposed. (No impact is concluded because 0.02 percent variation is well within the variations in annual energy use due to variations in average temperature and fluctuations in regional employment and manufacturing.)

Table 6-1: Estimated Energy Consumption from Construction Activities - Bus Rapid Transit Alternative

Construction Component	BTU/2012$	Construction Estimate (2012 $1,000)	Billion BTU	Typical Elements
Guideway	5,940	239	1	Concrete, Reinforcing Steel
Stations	5,940	702	4	Concrete, Reinforcing Steel, Canopy, Conduits, Lighting Fixtures
Maintenance Facilities	7,310	0	0	Maintenance Building, Equipment, Heating, Ventilation, Air Conditioning
Site Work	5,940	7,990	48	Earthwork, Removals, Utility Relocations
Systems	9,130	4,130	38	Signals, Fare Vending, Communications, Traffic Signal Priority System
Total Estimated Construction BTU			91	

BTU - British thermal units

6.13.2 Union Pacific Railroad Rail Alternative - Right-of-Way Option

Energy impacts from construction activities were computed based on typical values for construction categories. Construction energy use would vary slightly between the UPRR options.

Table 6-2 provides a summary of the energy use during construction for the UPRR Rail Alternative ROW Option. The construction energy use would be a very small fraction of energy use in the region (approximately 6 trillion BTU compared to the total annual Cook County energy consumption of 530 trillion BTU, less than 1.2 percent of the total annual Cook County energy consumption).

Table 6-2: Estimated Energy Consumption from Construction Activities - Union Pacific Railroad Rail Alternative - Right-of-Way Option

Construction Component	BTU/2012$	Construction Estimate (2012 $1,000)	Billion BTU	Typical Elements
Track and Guideway	5,940	264,000	1,568	Structural Steel, Track, Concrete, Reinforcing Steel
Stations	5,940	186,000	1,105	Concrete, Reinforcing Steel, Canopy, Conduits, Lighting Fixtures, Glass
Maintenance Facilities	7,310	71,000	519	Maintenance Building, Equipment, Heating, Ventilation, Air Conditioning
Site Work	5,940	133,000	790	Earthwork, Removals, Utility Relocations
Systems	9,130	239,000	2,182	Signals, Fare Vending, Communications, Traction Power, Substations
Total Estimated Construction BTU			6,164	

BTU - British thermal units

6.13.3 Union Pacific Railroad Rail Alternative - East Option

For the UPRR Rail Alternative East Option, Table 6-3 provides a summary of construction-related energy use. Construction energy use would be a very small fraction of the energy use in the region (approximately 6 trillion BTU compared to the total annual Cook County energy consumption of 530 trillion BTU, less than 1.2 percent of the total annual Cook County energy consumption).

Table 6-3: Estimated Energy Consumption from Construction Activities - Union Pacific Railroad Rail Alternative - East Option

Construction Component	BTU/2012$	Construction Estimate (2012 $1,000)	Billion BTU	Typical Elements
Track and Guideway	5,940	263,000	1,562	Structural Steel, Track, Concrete, Reinforcing Steel
Stations	5,940	189,000	1,123	Concrete, Reinforcing Steel, Canopy, Conduits, Lighting Fixtures, Glass
Maintenance Facilities	7,310	71,000	519	Maintenance Building, Equipment, Heating, Ventilation, Air Conditioning
Site Work	5,940	136,000	808	Earthwork, Removals, Utility Relocations
Systems	9,130	240,000	2,191	Signals, Fare Vending, Communications, Traction Power, Substations
Total Estimated Construction BTU			6,203	

BTU - British thermal units

6.13.4 Union Pacific Railroad Rail Alternative - West Option

Table 6-4 provides a summary of construction-related energy use for the UPRR Rail Alternative West Option. Construction energy use would be a very small fraction of the energy use in the region (approximately 6 trillion BTU compared to the total annual Cook County energy consumption of 530 trillion BTU, less than 1.2 percent of the total annual Cook County energy consumption).

Table 6-4: Estimated Energy Consumption from Construction Activities - Union Pacific Railroad Rail Alternative - West Option

Construction Component	BTU/2012$	Construction Estimate (2012 $1,000)	Billion BTU	Typical Elements
Track and Guideway	5,940	269,000	1,598	Structural Steel, Track, Concrete, Reinforcing Steel
Stations	5,940	195,000	1,158	Concrete, Reinforcing Steel, Canopy, Conduits, Lighting Fixtures, Glass
Maintenance Facilities	7,310	71,000	519	Maintenance Building, Equipment, Heating, Ventilation, Air Conditioning
Site Work	5,940	137,000	814	Earthwork, Removals, Utility Relocations
Systems	9,130	237,000	2,164	Signals, Fare Vending, Communications, Traction Power, Substations
Total Estimated Construction BTU			6,253	

BTU - British thermal units

6.13.5 Halsted Rail Alternative

Table 6-5 provides a summary of construction energy use for the Halsted Rail Alternative. Construction energy use would be a very small fraction of energy use in the region (approximately 7 trillion BTU compared to the total annual Cook County energy consumption of 530 trillion BTU, less than 1.3 percent of the total annual Cook County energy consumption).

Table 6-5: Estimated Energy Consumption from Construction Activities - Halsted Rail Alternative

Construction Component	BTU/2012$	Construction Estimate (2012 $1,000)	Billion BTU	Typical Elements
Track and Guideway	5,940	424,000	2,519	Structural Steel, Track, Concrete, Reinforcing Steel
Stations	5,940	140,000	832	Concrete, Reinforcing Steel, Canopy, Conduits, Lighting Fixtures, Glass
Maintenance Facilities	7,310	62,000	453	Maintenance Building, Equipment, Heating, Ventilation, Air Conditioning
Site Work	5,940	109,000	647	Earthwork, Removals, Utility Relocations
Systems	9,130	265,000	2,419	Signals, Fare Vending, Communications, Traction Power, Substations
Total Estimated Construction BTU			6,870	

BTU - British thermal units

6.14 Environmental Justice

A majority of the project area consists of minority populations; some of which are low-income populations as well. Because all of the impacts and benefits would occur in the same communities for all the alternatives, none of the construction impacts would be disproportionately adverse to these populations. Temporary construction easements would not result in displacements or relocations. No Environmental Justice mitigation would be required beyond that which is proposed in the other technical memoranda.

6.15 Transportation

During construction, vehicles, pedestrians, buses, and trains may need to be rerouted around the construction sites. Rerouting of traffic may be done using detours and/or complete street closures. The street closures could include main streets and side streets, as well as alleys and access points. Station and viaduct construction activities would be sequenced around street and alley closures. Temporary traffic lanes, temporary access points, or staged construction would be used. The following activities would be part of the traffic rerouting activities:

- Construction signage and temporary traffic barriers.
- Temporary reductions in number of thru-traffic lanes in each direction from two to one, if feasible.
- Detours/complete street closures, including alleys and access points.
- Temporary traffic lanes.
- Designated space for storage and staging of construction materials, equipment, and temporary facilities within the ROW, including parking areas or maintenance yard.
- Construction vehicle access points within and/or adjacent to the ROW.
- Business, residential, and pedestrian impacts including limited parking or parking bans.
- Advance trackwork and signalization to facilitate train reroutes (for the rail alternatives).
- Alternate bus routes and temporary CTA service changes may be required during construction of the RLE Project at the 95th Street Terminal.
    - CTA track shutdowns during nights or weekends may be required (for the rail alternatives).
    - Trains would operate on one or two tracks through the construction zones (for the rail alternatives). Flagmen would be required to notify trains of construction activities.

6.15.1 Bus Rapid Transit Alternative

6.15.1.1 Public Transportation

The BRT Alternative would include construction of improved bus shelters at four locations, four park & ride parking lots, and one proposed traffic signal. Existing traffic signals would be reprioritized. The construction activities associated with this alternative would temporarily affect the physical capacity of roadways and intersections, which may lead to increased travel times and possible shift in traffic volumes and the need to reroute bus transit service and move stop locations. With adherence to local, state, and federal construction and temporary traffic and public transportation management guidelines, no adverse impacts would result from construction of the BRT Alternative.

6.15.1.2 Traffic

The construction activities associated with this alternative would temporarily affect the physical capacity of local roadways and intersections, which may lead to increased travel times and possible shift in traffic volumes and the need to reroute traffic during construction. With adherence to local, state, and federal construction and temporary traffic management guidelines, no adverse impacts would result from construction of the BRT Alternative.

6.15.1.3 Freight Transportation

Construction of the proposed parking lot northeast of the UPRR tracks may require flagging safety near train operations; however, track closures would not be required. Construction activities would be phased to ensure that impacts on freight trains are minimized.

6.15.1.4 Bicycle

Temporary construction impacts for bicycles associated with the BRT Alternative may occur at the locations of new bus shelters and surface parking lots. Some construction activities may reduce the capacity of the roadway due to maintenance of traffic during construction activities. This may lead to increased travel times for bicyclists; however, there are no existing or proposed bicycle routes along Michigan Avenue, the proposed alignment of the BRT Alternative.

6.15.1.5 Pedestrian

Temporary construction impacts for pedestrians associated with the BRT Alternative would occur at the locations of the four upgraded bus shelters and park & ride lots. Some construction activities may result in a temporary sidewalk closure on one side of the street.

6.15.1.6 Parking Facilities

On-street parking along the roadways would be temporarily affected for construction of park & ride lots and bus shelters due to maintenance of traffic during construction activities.

6.15.2 Union Pacific Railroad Rail Alternative - Right-of-Way Option

6.15.2.1 Public Transportation

The construction activities associated with the UPRR Rail Alternative ROW Option would temporarily affect the physical capacity of roadways and intersections, requiring detours. Train and bus service, include Pace service, at the 95th Street Terminal may also be affected. These impacts may lead to increased travel times and possible shift in traffic volumes and increase travel times for bus transit users. Bus stop locations may be eliminated or relocated temporarily and buses may be rerouted during construction activities. With adherence to local, state, and federal construction and temporary traffic and public transportation management guidelines, no adverse impacts would result from construction of the UPRR Alternative ROW Option.

The UPRR Alternative ROW Option would consist of new construction of dual-track, elevated structure within the UPRR ROW, branching off and running along the east side of the corridor and over existing CN/ME tracks. Construction at the CN/ME crossing would be phased to ensure there are no impacts on Metra operations. During new track roadbed construction for the 120th Street yard and shop and the new access road for the existing MWRD facility, construction over and adjacent to the NICTD/CSS & SBRR would occur. During these construction activities, flagging operations and scheduled track closures would occur. Construction would be phased to ensure there are no impacts on passenger trains.

6.15.2.2 Traffic

The construction activities associated with this alternative would temporarily affect the physical capacity of local roadways and intersections, which may lead to increased travel times and possible shift in traffic volumes and the need to reroute traffic during construction.

Work within the median of I-94 would require temporary lane closures. Proposed structure construction would be sequenced to minimize impacts on the traffic flow on I-94. Increased traffic congestion due to construction activities may temporarily increase travel times along this portion of I-94.

Dual-track, elevated structures would be constructed through the I-94/I-57 interchange, across the WB I-57 entrance ramp from NB I-94, and within the I-57 corridor. For superstructure erection over expressway traffic lanes, temporary shutdown of all traffic would be required. Temporary shutdown of traffic would occur at nighttime and during low-traffic-volume intervals per IDOT and CDOT approval. Proposed structure construction would be sequenced to minimize impacts on the traffic flow on I-57. Increased traffic congestion due to construction activities may temporarily increase travel times along this portion of I-57.

With adherence to local, state, and federal construction and temporary traffic management guidelines, no adverse impacts would result from construction of the UPRR ROW Alternative.

6.15.2.3 Freight Transportation

The UPRR ROW Alternative would consist of new construction of a dual-track, elevated structure within the UPRR corridor, branching off and running along the east side of the corridor and over existing CN/ME tracks. There would be no impact on UPRR operations due to construction activities, because UPRR trains would be relocated to another corridor as part of a separate, earlier project. Construction at the CN/ME crossing would be phased to minimize the impacts on CN and Metra operations.

Work within the median of I-94 would require temporary lane closures. Proposed structure construction would be sequenced to minimize impacts on the traffic flow on I-94. Increased traffic congestion due to construction activities may temporarily increase freight truck travel times and cost for shipping routes that include this portion of I-94.

Dual-track, elevated structures would be constructed through the I-94/I-57 interchange, across the WB I-57 entrance ramp from NB I-94, and within the I-57 corridor. For superstructure erection over expressway traffic lanes, temporary shutdown of all traffic would be required. Temporary shutdown of traffic would occur at nighttime and during low-traffic-volume intervals per IDOT and CDOT approval. Proposed structure construction would be sequenced to minimize impacts on the traffic flow on I-57. Increased traffic congestion due to construction activities may temporarily increase freight truck travel times and cost for shipping routes that include this portion of I-57.

During new track roadbed construction for the 120th Street yard and shop and the new access road for the existing MWRD facility, construction over and adjacent to the NICTD/CSS & SBRR would occur. During these construction activities, flagging operations and scheduled track closures would occur. Construction would be phased to minimize impacts on freight operations.

A portion of the new track alignment would be constructed over abandoned Indiana Harbor Belt Railroad (IHB) tracks north of 130th Place. Construction activities would be coordinated with IHB to ensure that no construction activities would affect freight operations.

6.15.2.4 Bicycle

Bicyclists using recommended collector streets such as 103rd Street, 111th Street, or Michigan Avenue may incur increased travel times due to detours or increase vehicular traffic due to construction activities.

6.15.2.5 Pedestrian

During construction of the aerial structure and stations, some sidewalks would need to be temporarily closed. Increased travel distance and time may be incurred due to pedestrian traffic reroutes.

6.15.2.6 Parking Facilities

On-street parking would be temporarily affected during construction of the aerial structure and stations. Construction of park & ride lots would also contribute to temporary on-street parking loss due to maintenance of traffic during construction activities.

6.15.3 Union Pacific Railroad Rail Alternative - East Option

6.15.3.1 Public Transportation

Potential construction impacts on public transportation associated with the UPRR East Option would be the same as those of the UPRR ROW Option.

6.15.3.2 Traffic

The construction activities associated with this alternative would temporarily affect the physical capacity of local roadways and intersections, which may lead to increased travel times and possible shift in traffic volumes and the need to reroute traffic during construction. Please refer to the *Transportation Technical Memorandum* for additional traffic information.

Work within the median of I-94 would require temporary lane closures. Proposed structure construction would be sequenced to minimize impacts on the traffic flow on I-94. Increased traffic congestion due to construction activities may temporarily increase travel times along this portion of I-94.

The UPRR Alternative East Option alignment curves over I-57 and runs parallel to the UPRR tracks. Dual-track, elevated structures would be constructed through the I-94/I-57 interchange, across the WB I-57 entrance ramp from NB I-94, and within the I-57 corridor. For superstructure erection over expressway traffic lanes, temporary shutdown of all traffic would be required. Temporary shutdown of traffic would occur at nighttime and during low-traffic-volume intervals per IDOT and CDOT approval. Proposed structure construction would be sequenced to minimize impacts on the traffic flow on I-57. Increased traffic congestion due to construction activities may temporarily increase travel times along this portion of I-57.

With adherence to local, state, and federal construction and temporary traffic management guidelines, no adverse impacts would result from construction of the UPRR Alternative East Option.

6.15.3.3 Freight Transportation

The UPRR Alternative East Option would consist of new construction of dual-track, elevated structure immediately adjacent to and east of the UPRR ROW, branching off and running along the east side of the corridor and over existing CN/ME tracks. The East Option would require the construction activities to occur while UPRR tracks are operational. The work would be sequenced along the UPRR corridor to minimize impacts on UPRR operations. Construction adjacent to railroads would require flagging operations and scheduled track closures. Construction at the CN/ME crossing would be phased to minimize the impacts on CN freight operations.

Work within the median of I-94 would require temporary lane closures. Proposed structure construction would be sequenced to minimize impacts on the traffic flow on I-94. Increased traffic congestion due to construction activities may temporarily increase freight truck travel times and cost for shipping routes that include this portion of I-94.

The UPRR Alternative East Option alignment curves over I-57 and runs parallel to the UPRR tracks. Dual-track, elevated structures would be constructed through the I-94/I-57 interchange, across the WB I-57 entrance ramp from NB I-94, and within the I-57 corridor. For superstructure erection over expressway traffic lanes, temporary shutdown of all traffic would be required. Temporary shutdown of traffic would occur at nighttime and during low-traffic-volume intervals per IDOT and CDOT approval. Proposed structure construction would be sequenced to minimize impacts on the traffic flow on I-57. Increased traffic congestion due to construction activities may temporarily increase freight truck travel times and cost for shipping routes that include this portion of I-57.

During new track roadbed construction for the 120th Street yard and shop and the new access road for the existing MWRD facility, construction over and adjacent to the NICTD/CSS & SBRR would occur. During these construction activities, flagging operations and scheduled track closures would occur. Construction would be phased to minimize impacts on freight operations.

A portion of the new track alignment would be constructed over abandoned IHB tracks north of 130th Place. Construction activities would be coordinated with IHB to ensure that no construction activities would affect freight operations.

6.15.3.4 Bicycle

The bicycle impacts of the UPRR Alternative East Option would be similar to those of the UPRR Alternative ROW Option.

6.15.3.5 Pedestrian

The pedestrian impacts of the UPRR Alternative East Option would be similar to those of the UPRR Alternative ROW Option.

6.15.3.6 Parking Facilities

The parking facility impacts of the UPRR Alternative East Option would be similar to those of the UPRR Alternative ROW Option.

6.15.4 Union Pacific Railroad Rail Alternative - West Option

6.15.4.1 Public Transportation

Potential construction impacts on public transportation associated with the UPRR West Option would be the same as those of the UPRR ROW Option.

6.15.4.2 Traffic

The construction activities associated with this alternative would temporarily affect the physical capacity of local roadways and intersections, which may lead to increased travel times and possible shift in traffic volumes and the need to reroute traffic during construction.

Work within the median of I-94 would require temporary lane closures. Proposed structure construction would be sequenced to minimize impacts on the traffic flow on I-94. Increased traffic congestion due to construction activities may temporarily increase travel times along this portion of I-94.

Dual-track, elevated structures would be constructed through the I-94/I-57 interchange, across the WB I-57 entrance ramp from NB I-94, and within the I-57 corridor. For superstructure erection over expressway traffic lanes, temporary shutdown of all traffic would be required. Temporary shutdown of traffic would occur at nighttime and during low-traffic-volume intervals per IDOT and CDOT approval. Proposed structure construction would be sequenced to minimize impacts on the traffic flow on I-57. Increased traffic congestion due to construction activities may temporarily increase travel times along this portion of I-57.

With adherence to local, state, and federal construction and temporary traffic management guidelines, no adverse impacts would result from construction of the UPRR Alternative West Option.

6.15.4.3 Freight Transportation

The UPRR Alternative West Option would consist of new construction of dual-track, elevated structure crossing over the UPRR at Fernwood Parkway just south of I-57 and continuing immediately adjacent to and west of the UPRR ROW, crossing over the UPRR tracks again at Prairie Avenue and running along the east side of the corridor and over existing CN/ME tracks. The West Option would require the construction activities to occur while UPRR tracks are operational. This alternative would have two crossings over the active UPRR tracks that the East Option would not have: at Fernwood Parkway and Prairie Avenue. Construction at these crossings would be phased to minimize impacts on UPRR freight operations. Construction adjacent to railroads would require flagging operations and scheduled track closures. Construction activities would be phased to reduce impacts on the UPRR operations as much as possible. Construction at the CN/ME crossing would be phased to minimize the impacts on CN freight operations.

Work within the median of I-94 would require temporary lane closures. Proposed structure construction would be sequenced to minimize impacts on the traffic flow on I-94. Increased traffic congestion due to construction activities may temporarily increase freight truck travel times and cost for shipping routes that include this portion of I-94.

Dual-track, elevated structures would be constructed through the I-94/I-57 interchange, across the WB I-57 entrance ramp from NB I-94, and within the I-57 corridor. For superstructure erection over expressway traffic lanes, temporary shutdown of all traffic would be required. Temporary shutdown of traffic would occur at nighttime and during low-traffic-volume intervals per IDOT and CDOT approval. Proposed structure construction would be sequenced to minimize impacts on the traffic flow on I-57. Increased traffic congestion due to construction activities may temporarily increase freight truck travel times and cost for shipping routes that include this portion of I-57.

During new track roadbed construction for the 120th Street yard and shop and new access road for the existing MWRD facility, construction over and adjacent to the NICTD/CSS & SBRR would occur. During these construction activities, flagging operations and scheduled track closures would occur. Construction would be phased to minimize impacts on freight operations.

A portion of the new track alignment would be constructed over abandoned IHB tracks north of 130th Place. Construction activities would be coordinated with IHB to ensure that no construction activities would affect freight operations.

6.15.4.4 Bicycle

The bicycle impacts of the UPRR Alternative West Option would be similar to those of the UPRR Alternative ROW Option.

6.15.4.5 Pedestrian

The pedestrian impacts of the UPRR Alternative West Option would be similar to those of the UPRR Alternative ROW Option.

6.15.4.6 Parking Facilities

The parking facility impacts of the UPRR Alternative West Option would be similar to those of the UPRR Alternative ROW Option.

6.15.5 Halsted Rail Alternative

6.15.5.1 Public Transportation

The construction activities associated with the Halsted Rail Alternative would temporarily affect the physical capacity of roadways and intersections, requiring detours. Superstructure erection would require temporary shutdown of all traffic on Halsted Street, which may lead to increased travel times and a shift in traffic volumes, increasing travel times for bus transit users. Bus stop locations may be eliminated or relocated temporarily and buses rerouted, including Pace service, during construction activities. With adherence to local, state, and federal construction and temporary traffic and public transportation management guidelines, no adverse impacts would result from construction of the Halsted Rail Alternative.

The Metra Electric Blue Island line crosses Halsted Street between 120th Street and 122nd Street, and its West Pullman station is west of Halsted Street. Construction of the aerial structure would require temporary scheduled track closures and would be phased to minimize impacts on Metra operations.

6.15.5.2 Traffic

The construction activities associated with this alternative would temporarily affect the physical capacity of local roadways and intersections, which may lead to increased travel times and possible shift in traffic volumes and the need to reroute traffic during construction.

Work within the median of I-94 would require temporary lane closures. Proposed structure construction would be sequenced to minimize impacts on the traffic flow on I-94. Increased traffic congestion due to construction activities may temporarily increase travel times along this portion of I-94.

Dual-track, elevated structures would be constructed through the I-94/I-57 interchange, across the WB I-57 entrance ramp from NB I-94, and within the I-57 corridor. For superstructure erection over expressway traffic lanes, temporary shutdown of all traffic would be required. Temporary shutdown of traffic would occur at nighttime and during low-traffic-volume intervals per IDOT and CDOT approval. Proposed structure construction would be sequenced to minimize impacts on the traffic flow on I-57. Increased traffic congestion due to construction activities may temporarily increase travel times along this portion of I-57.

The construction activities associated with the Halsted Rail Alternative would temporarily affect the physical capacity of roadways and intersections, requiring detours. Superstructure erection would require temporary shutdown, in segments, of all traffic on Halsted Street. This may lead to increased travel times and possible shift in traffic volumes, increasing travel times for those using Halsted Street.

With adherence to local, state, and federal construction and temporary traffic management guidelines, no adverse impacts would result from construction of the Halsted Rail Alternative.

6.15.5.3 Freight Transportation

Work within the median of I-94 would require temporary lane closures. Proposed structure construction would be sequenced to minimize impacts on the traffic flow on I-94. Increased traffic congestion due to construction activities may temporarily increase freight truck travel times and cost for shipping routes that include this portion of I-94.

The Halsted Rail Alternative alignment crosses over the UPRR at Fernwood Parkway and I-57. Dual-track, elevated structures would be constructed through the I-94/I-57 interchange, across the WB I-57 entrance ramp from NB I-94, and within the I-57 corridor. For superstructure erection over expressway traffic lanes, temporary shutdown of all traffic would be required. Temporary shutdown of traffic would occur at nighttime and during low-traffic-volume intervals per IDOT and CDOT approval. Proposed structure construction would be sequenced to minimize impacts on the traffic flow on I-57. Increased traffic congestion due to construction activities may temporarily increase freight truck travel times and cost for shipping routes that include this portion of I-57.

The construction activities associated with the Halsted Rail Alternative would temporarily affect the physical capacity of roadways and intersections requiring detours. Superstructure erection would require temporary shutdown of all traffic on Halsted Street. This may lead to increased travel times and possible shift in traffic volumes, increasing travel times for freight trucks using Halsted Street. There would be no construction impacts on rail freight transportation because no freight train tracks are near or cross the Halsted Rail Alternative Alignment.

6.15.5.4 Bicycle

Portions of the Major Taylor bike trail would need to be closed temporarily during the construction of the 119th Street station and the aerial structure. Bicycle travel times may increase due to detours or shifting of routes.

6.15.5.5 Pedestrian

During construction of the aerial structure and station construction, some sidewalks would need to be temporarily closed. Increased travel distance and time may be incurred due to pedestrian traffic reroutes.

6.15.5.6 Parking Facilities

On-street parking would be temporarily affected during construction of the aerial structure and stations. Parking would potentially be eliminated from Halsted Street during construction to increase traffic flow. Construction of park & ride lots would also contribute to temporary on-street parking loss due to maintenance of traffic during construction activities.

6.16 Cumulative Impacts

Construction impacts from the other potentially concurrent projects identified in the *Cumulative Impacts Technical Memorandum* would not be likely to result in cumulative impacts when combined with RLE Project construction. No cumulative construction impacts would occur and mitigation measures beyond those already identified for direct impacts due to construction would not be required. Should construction of other nearby projects occur simultaneously with the RLE Project, CTA would coordinate construction activities among the projects to minimize disruption and use of resources.

Section 7
Impacts Remaining After Mitigation

Because of the temporary nature of construction activities, the use of construction BMP, and proposed mitigation methods, the construction impacts from the build alternatives would be considered not adverse. No construction impacts would occur with the No Build Alternative and no mitigation measures would be required.

Appendix A
Construction Matrix

Note: The information shown in this table reflects construction assumptions for the purposes of NEPA analysis of impacts. It represents the types and order of magnitude of construction activities associated with each alternative. It is not meant to be a final construction plan. A specific construction plan for the preferred alternative presented in the Final EIS will be prepared as design of the project proceeds.

UPRR HRT ROW Option		Construction Equipment

Appendix B
2014–2015 Red Line Extension Project Update

2014–2015 Red Line Extension Project Update

From 2012-2014, CTA evaluated benefits and impacts of four alternatives: the No Build Alternative, the Bus Rapid Transit Alternative (along Michigan Avenue), the Union Pacific Railroad (UPRR) Rail Alternative, and the Halsted Alternative. CTA evaluated three options of the UPRR Rail Alternative: Right-of-Way Option, East Option, and West Option. CTA also evaluated two options of the UPRR Rail Alternative 130th Street station: a South Station Option and a West Station Option. Based on the project description provided in Section 2 of this technical memorandum, CTA analyzed the impacts of these alternatives and station options. The benefits and impacts are included in the technical memoranda prepared in 2012-2014.

In August 2014, based on the technical analysis and public input, CTA announced the NEPA Preferred Alternative—the UPRR Rail Alternative. Additional conceptual engineering was conducted on the UPRR Rail Alternative to refine the East and West Option alignments. In addition, CTA is considering only the South Station Option of the 130th Street Station.

In late 2014 and early 2015, CTA conducted additional engineering and revised assumptions on the East and West Options to refine the alignments. The refinement of the East and West Options consisted of the following items:

- For the segment of the alignment along I-57, CTA shifted the proposed alignment from the median of I-57 to the north side of I-57 within the existing expressway right-of-way. The construction would be less complex, safer for construction workers, and have a shorter duration. The shift would also allow for fewer impacts to Wendell Smith Park for the East Option, and would allow for no permanent impacts to Wendell Smith Park for the West Option.
- CTA modified the curve speeds as the alignment heads south from I-57 along the UPRR tracks. The curve speed for both the East and West Options would be 35 mph.
- CTA shifted the East Option alignment near 103rd Street station to minimize impacts to Block Park and the Roseland Pumping Station.
- CTA modified the curves south of 103rd Street for both the East and West Options to 55 mph to maximize the train speed.
- CTA refined the layout of the 120th Street yard and shop to optimize yard operations. The refined layout of the yard would accommodate 340 train cars.

The refinement of the East and West Option alignments minimizes potential impacts to parks while providing flexibility for future design phases. The Draft Environmental Impact Statement contains the benefits and impacts of the refined East and West Option alignments and supersedes information presented in other chapters of this technical memorandum.

The refined East and West Option alignments would have no additional or different impacts from those described in the technical memoranda for the following resource areas: construction, transportation, land use and economic development, historic and cultural resources, safety and security, hazardous materials, indirect and cumulative, air quality, floodplains, vegetation and wildlife habitat, threatened and endangered species, and geology and soils.

Section 1
Summary

This technical memorandum analyzes the potential impacts of the Red Line Extension (RLE) Project on land use and economic development.

Per Federal Transit Administration (FTA) guidance, a land use change would cause an adverse impact if it would result in any of the following:

- An alignment would not be compatible with surrounding land uses.
- An alignment would encourage land use and development that is inconsistent with local plans, goals, and objectives.

The area of potential impact (API) for determining potential land use and economic development impacts and benefits for the RLE Project includes parcels directly adjacent to the build alternative alignments, for the full length of the alignments, as well as those parcels within a ½-mile radius of station locations per FTA guidance.

Each alternative was analyzed for potential impacts on existing and expected land use types, densities, and character resulting from permanent impacts, construction impacts, and cumulative impacts. This analysis determined the following:

- The Bus Rapid Transit (BRT) Alternative would improve land use accessibility between station areas and the 95th Street Terminal and downtown Chicago, but not as much as the Union Pacific Railroad (UPRR) Alternative options or the Halsted Rail Alternative. Travel time savings to downtown Chicago for each affected neighborhood would be greater for the BRT Alternative than for the No Build Alternative.
- Travel time savings would encourage new development or redevelopment within station areas for the UPRR Rail Alternative options or the Halsted Rail Alternative. The extent of such development activity would depend on factors such as local plans, policies, zoning, and financial incentives. The BRT Alternative would not encourage new development due to the lack of rail-like elements, such as exclusive travel lanes and substantial stations, which are typically cited as necessary to attract the attention of private developers.
- The UPRR Rail Alternative would be consistent with local and regional land use and economic development plans in the project area, as well as the U.S. Department of Transportation Livability Initiative. Because the UPRR Rail Alternative would provide new transit service to relatively isolated South Side neighborhoods, the permanent impacts would be beneficial for land use and economic development.

- The BRT Alternative would result in no adverse impacts on land use or economic development and would be consistent with existing land uses.

- Although it is not included in local and regional land use and economic development plans, the Halsted Rail Alternative would provide beneficial impacts on land use and economic impacts. The Halsted Rail Alternative would, however, result in an adverse impact on adjacent single-family residential land uses in West Pullman due to the proposed seven-story parking garage at the Vermont Avenue station.

- Property acquisitions would temporarily reduce the property tax base, but affected residences and businesses could be relocated within the same neighborhoods due to the availability of residential and commercial real estate.

Table 1-1 highlights the land use and economic development impacts of each alternative on the directly affected neighborhoods within the project area. These impacts are presented with mitigation factored into the analysis. If an alternative alignment would not pass through a neighborhood, the impact category assigned to that neighborhood is "Not Applicable," which is represented by dash marks. Section 5 of the technical memorandum provides the specific impact analysis for the proposed alternatives.

Updated July 27, 2015
In August 2014, based on the technical analysis and public input until then, CTA announced the NEPA Preferred Alternative—the UPRR Rail Alternative. CTA is considering two alignment (route) options of this alternative: the East Option and the West Option. At this time, CTA is also considering only the South Station Option of the 130th Street Station. In late 2014 and early 2015, CTA conducted additional engineering on the East and West Options to refine the East and West Option alignments. Appendix B of this technical memorandum summarizes the refined alignments and any additional or different impacts that would result. The information in Appendix B supersedes information presented in other chapters of this technical memorandum.

Section 2
Project Description

The Chicago Transit Authority (CTA) is proposing to extend the Red Line from the existing 95th Street Terminal to the vicinity of 130th Street, subject to the availability of funding. The proposed RLE would include four stations. Each station would include bus transfer and parking facilities. This project is one part of the Red Ahead Program to extend and enhance the entire Red Line. The CTA is also planning 95th Street Terminal improvements that are anticipated to be completed prior to the proposed RLE construction.

The project area is 11 miles south of the Chicago central business district (commonly referred to as the Loop) and encompasses approximately 20 square miles. The boundaries of the project area are 95th Street on the north, Ashland Avenue on the west, Stony Island Avenue on the east, and the Calumet-Sag Channel/Little Calumet River and 134th Street on the south. The I-57 Expressway and I-94 Bishop Ford Freeway cross the western and eastern edges of the project area, respectively. Lake Calumet is in the eastern portion of the project area. The project area encompasses parts of nine community areas in the City of Chicago and the eastern section of the Village of Calumet Park. Chicago community areas include Beverly, Washington Heights, Roseland, Morgan Park, Pullman, West Pullman, Riverdale, Hegewisch, and South Deering. The project area comprises residential (primarily single family), industrial (both existing and vacant), transportation (including freight), and commercial development.

The Draft Environmental Impact Statement (EIS) focuses on the following alternatives (shown in Figure 2-1), which emerged from the Alternatives Analysis and the National Environmental Policy Act (NEPA) scoping process:

- No Build Alternative
- BRT Alternative
- UPRR Rail Alternative
    - Right-of-Way (ROW) Option
    - East Option
    - West Option
- Halsted Rail Alternative

Figure 2-1: Red Line Extension Project Alternatives

The No Build Alternative is a required alternative as part of the NEPA environmental analysis and is used for comparison purposes to assess the relative benefits and impacts of extending the Red Line. The No Build Alternative is carried into the Draft EIS phase of the project development regardless of its performance versus the build alternatives under consideration. No new infrastructure would be constructed as part of the No Build Alternative other than committed transportation improvements that are already in the Chicago Metropolitan Agency for Planning (CMAP) Fiscal Year 2010–2015 Transportation Improvement Program (TIP) and the improvements to 95th Street Terminal. The TIP projects within the project area consist of four bridge reconstructions, several road improvement projects including resurfacing and coordination of signal timing on 95th Street, work on Metra's facilities, construction of a bicycle/pedestrian multi-use trail, and preservation of historic facilities. The No Build Alternative includes regular maintenance of existing track and structures, and bus transit service would be focused on the preservation of existing services and projects. All elements of the No Build Alternative are included in each of the other alternatives. Under this alternative, travel times would not improve from existing conditions.

The BRT Alternative (formerly referred to as the Transportation Systems Management Alternative) is a 5.0-mile, limited-stop, enhanced BRT route, which is assumed to operate 24 hours per day between the existing 95th Street Terminal and the intersection of 130th Street and Eberhart Avenue. No dedicated bus lanes would be provided for the BRT Alternative; however, parking lanes would be removed for some portions of the alignment and four stops with improved bus shelters and park & ride facilities would be created at 103rd Street and Michigan Avenue, 111th Street and Michigan Avenue, Kensington Avenue and Michigan Avenue, and 130th Street and Eberhart Avenue. Although BRT service elements would not continue south of the 130th Street stop, the bus route would continue through Altgeld Gardens along the existing route with six stops. The BRT Alternative would be consistent with bus routing changes that may occur as part of improvements to the 95th Street Terminal. Under this alternative, travel times between 130th Street and the Loop would improve over existing conditions.

The UPRR Rail Alternative is a 5.3-mile extension of the heavy rail transit Red Line from its existing 95th Street Terminal to 130th Street, just west of I-94. The Chicago Transit Board designated the UPRR Rail Alternative as the Locally Preferred Alternative at its August 12, 2009 board meeting. This alternative includes construction and operation of new heavy rail transit tracks, mostly in existing transportation corridors. The UPRR Rail Alternative has three options for alignment (ROW, East, and West), all of which would include operation on elevated structure from 95th Street to just past the Canadian National/Metra Electric District tracks near 119th Street. The alignment would then transition to at-grade through an industrial area with no public through streets, terminating at 130th Street in the vicinity of Altgeld Gardens. Four new stations would be constructed at 103rd Street, 111th Street, Michigan Avenue, and 130th Street. The 130th Street station would be the terminal station, with two options under evaluation: the South Station Option and the West Station Option. A new yard and shop facility would be sited near 120th Street and Cottage Grove Avenue. The bus routes in the vicinity of the UPRR Rail Alternative would be modified to enhance connectivity between the Red Line and the bus network. The hours of operation and service frequency for the UPRR Rail Alternative are assumed to be the same as

for the current Red Line. Under this alternative, travel times between 130th Street and the Loop would improve substantially over existing conditions.

The Halsted Rail Alternative is a 5.0-mile heavy rail transit extension of the existing Red Line. In this alternative, the Red Line would operate on an elevated structure running south from 95th Street along I-57 until Halsted Street. The alignment would then turn south and continue along Halsted Street to the intersection of Halsted Street and Vermont Avenue near 127th Street. This alternative would include four new stations at 103rd Street, 111th Street, 119th Street, and Vermont Avenue. The Vermont Avenue station would be the terminal station. A new yard and shop would be sited west of Halsted Street and between the 119th Street and Vermont Avenue stations. The bus routes in the vicinity of the Halsted Rail Alternative would be modified to enhance connectivity to the Red Line. The hours of operation and service frequency for the Halsted Rail Alternative are assumed to be the same as for the current Red Line. Under this alternative, travel times between 127th Street and the Loop would improve substantially over existing conditions. This alternative would not extend rail to Altgeld Gardens, which would be served by bus connecting to the Vermont terminal station.

Section 3
Methods for Impact Evaluation

This section describes the methods for analysis of potential impacts on land use and economic development. The types of impacts considered in this analysis include conflicts with or disruptions to existing land uses; inconsistencies with local and regional plans, policies, and regulations; and future land use and economic development benefits and opportunities presented by the alternatives.

3.1 Regulatory Framework

3.1.1 Federal

Sections 3 and 5 of the Urban Mass Transportation Act of 1964 require that federally funded transit projects be consistent with official plans for the comprehensive development of an area, as well as with a community's goals and objectives. To ensure compliance with this requirement, the FTA states that every environmental document should include maps that illustrate existing and proposed future land uses of the area around the proposed project alternative alignments. If a proposed project is fully consistent with existing and proposed land uses and will not be the impetus for new development that would be inconsistent with policies or plans, no further analysis is required.

In response to the U.S. Department of Transportation Livability Initiative, a 2010 FTA directive indicated that analysis of transit projects' potential to increase livability, promote economic development, and support community growth should be considered as part of the criteria for FTA's programs. According to the directive, the FTA will seek to do the following:

- Provide more transportation choices.
- Promote equitable, affordable housing.
- Enhance economic competitiveness - access to employment centers, education, services and other basic needs.
- Support existing communities - transit-oriented, mixed-use development, and land recycling.
- Coordinate policies and leverage investment - leverage funding to plan for future growth.
- Value communities and neighborhoods - invest in healthy, safe, and walkable neighborhoods.

The CTA desires to seek FTA New Starts Program funding for the capital cost of the proposed project; therefore, the FTA New Starts guidelines were utilized to document the affected environment for land use and economic development, which provides the foundation for determining potential impacts on existing land uses and plans and policies. As authorized by Section 5309 of Title 49, United States Code, the FTA created the New Starts Program to efficiently and comparatively evaluate and rate major new capital investments nationwide. Section 5309(d)(6) requires the FTA to publish policy guidance on the major capital investment program review and evaluation process and criteria each time substantial changes are made.

On January 9, 2013, the FTA published a final rule implementing New Starts Program changes that are consistent with Moving Ahead for Progress in the 21st Century (MAP-21), which was signed into law in July 2012. Accompanying the final rule is FTA's Proposed New Starts and Small Starts Policy Guidance (January 9, 2013) to provide details on the measures and analytical techniques, which will be finalized later this year. The proposed guidance does not alter the basic criteria for analyzing existing land uses and economic development, with one exception. The quantity of affordable housing or certified public housing, and related plans and policies to increase affordable housing within a proposed transit corridor, was proposed as a new measure. The proposed guidance was used for the land use and economic development assessment for the RLE Project.

3.1.2 State

The Illinois Department of Transportation (IDOT) *Community Impact Assessment Manual* provides guidance for analyzing the impacts of a transportation project on land use and development as well as impacts on the regional and local economies (IDOT 2007).

3.1.3 Local

There are no local regulations requiring environmental analysis of land use impacts. Local and regional land use plans were reviewed to inform the land use and economic development assessment for the RLE Project. The applicable plans are listed below for reference.

Chicago Metropolitan Region:

- Chicago Metropolitan Agency for Planning (CMAP) *GO TO 2040 Regional Plan (2010)*

Cook County:

- *Cook County Comprehensive Economic Development Strategy Report (2009)*

City of Chicago:

- *Chicago Sustainable Industries, Phase One: A Manufacturing Work Plan for the 21st Century (2011)*
- *Transit-Friendly Development Guide (2009)*
- *The Chicago Central Area Plan (May 2003)*
- *City Space Plan for Chicago (1998)*

Village of Calumet Park:

Note: The Village does not have a recently adopted comprehensive plan; therefore, the Village Code and Zoning Map were utilized to assess future land use within the project area.

3.2 Impact Analysis Thresholds

NEPA does not set specific thresholds of significance for land use and economic development impacts. Guidance published by the FTA and IDOT was used as the basis for a qualitative evaluation of the potential for land use and economic development impacts at parcels adjacent to the RLE Project alternative alignments. The FTA and IDOT land use criteria, as described in the guidance manuals, were used as the basis for the thresholds of impact for this project. For the purposes of this technical memorandum, impacts on land use are based on the following:

- Will the project cause substantial changes in existing land use?
- Will the project facilitate or impede potential growth?
- Is the project located in a high growth region?
- Have there been recent zoning changes in the project area and will zoning changes occur due to project implementation?
- Will the project be compatible with surrounding land uses?
- Will the project encourage land use and development that is inconsistent with local plans, goals and objectives?

Per FTA and IDOT guidance, impacts on economic development are based on the following:

- Will the project result in taxation changes?
- Will the project affect a major employer?
- Which economic sectors might be affected by the project?
- Will the project result in substantial displacement of businesses and individuals?
- Will the project cause short-term and/or long-term disruption of business activities?
- Will the project have an influence on regional construction costs?

If one or more of the above impacts is anticipated, the expected impacts on the area and a discussion of alternative locations must be presented in the environmental document. In addition, the document must identify measures that would be used to mitigate any anticipated adverse impacts. There are no additional criteria at the state and local levels.

3.3 Area of Potential Impact

The API for determining potential land use and economic development impacts and benefits for the RLE Project includes parcels directly adjacent to the build alternative alignments, for the full length of the alignments, as well as those parcels within a ½-mile radius of stations per FTA's 2004 *Guidelines and Standards for Assessing Transit-Supportive Land Use* (see Figure 3-1).

3.4 Methods

The analysis of potential land use impacts associated with each alternative entailed the following components:

- Analysis of the potential for short-term and long-term conflict with, or disruption of access to, land uses adjacent to the alternative alignments.
- Identification of potential conflicts with applicable local land use plans, policies, or regulations.
- Identification of potential land use benefits of the alternatives, such as opportunities for economic development and transit-supportive land uses.

The EIS analyzed impacts at a general level and took into account the impacts of the project on the surrounding existing and future land use categories.

Figure 3-1: Land Use and Economic Development Area of Potential Impact

3.4.1 Land Use Incompatibility and Conflicts

The analysis began with an inventory of the existing land uses surrounding each alternative alignment, to identify the potential short- and long-term conflicts with land uses and potential disruption of access to land uses adjacent to the alternative alignments. The catalog of land uses relied on the land use designations provided by the applicable local land use plans, zoning ordinance designations, review of aerial photography, and observations made during field visits. Land use maps in the plans illustrate the land use designations for parcels near the alternative alignments.

Existing land uses were compared to the land uses that would be expected after implementation of each build alternative and/or the No Build Alternative to identify potential incompatibilities with and disruptions of existing land uses. The types of incompatibilities considered included the introduction of new transit facilities adjacent to sensitive land uses; the introduction of new land uses that are inconsistent with existing land uses; increased noise, security concerns, changes in lighting, transportation changes (e.g., pedestrian access to stations); and pedestrian safety concerns. The potential for land use incompatibility with regard to increased noise, security, lighting, transportation, and pedestrian safety is briefly summarized in this technical memorandum, but is discussed in greater detail in the separate technical memorandums that address those specific topics.

3.4.2 Policy Consistency

The analysis focused on each proposed alternative's consistency with the goals and policies presented in regional and local land use plans and regulations of the City of Chicago, Cook County, and CMAP, as well as the U.S. Department of Transportation Livability Initiative. The analysis determined whether the proposed alternatives would have differing levels of policy consistency.

3.4.3 Land Use and Economic Development Benefits

The analysis included an evaluation of the potential land use benefits associated with each of the proposed alternatives, such as opportunities for economic growth and development, increased transit-supportive development, enhanced livability, and the potential to boost local economic activity. Goals and policies presented in local land use plans and ordinances that encourage transit-supportive development were addressed, along with a comparison of how each proposed alternative would support these objectives. The potential for the proposed alternatives to generate public investment in transportation infrastructure, which would support economic vitality and environmentally sustainable communities, was also considered.

Section 4
Affected Environment

This section describes the existing and planned land use conditions, as well as the land use and economic development planning and policy framework, in the neighborhoods and jurisdictions affected by the proposed project. The analysis includes a description of existing and planned land uses within ½ mile of proposed station locations (referred to as station areas) and the alignment between station areas. The analysis also includes a review of land use and economic development plans and policies by jurisdiction. **Figure 4-1** identifies the City of Chicago neighborhoods affected by the RLE Project. Neighborhoods that may be directly affected by the proposed build alternatives include Washington Heights, Morgan Park, Roseland, West Pullman, and Riverdale.

4.1 Existing Land Uses

The overall project area has residential (primarily single family), commercial (urban mixed-use), industrial, transportation and utilities, and vacant land uses. **Figure 4-2** depicts the overall land uses affected by the RLE Project. The project area has numerous institutional land uses, including Chicago State University (7,200 students), Olive-Harvey College (4,300 students), and several high schools (including Harlan, Corliss, Fenger, Julian, Brooks, and Carver). Major activity centers in the project area include Halsted Street Commercial Corridor, Roseland Hospital, Sherwin-Williams, Ryerson, the Illinois International Port District, and Metron Steel. The Ford Motor plant at 130th Street and Torrence Avenue is just east of the project area and employs 2,800 people.

4.1.1 Bus Rapid Transit Alternative

The BRT Alternative alignment would begin at CTA's 95th Street Terminal, and continue east on 95th Street to Michigan Avenue, then on Michigan Avenue to 130th Street. The BRT route would pass through the Roseland, West Pullman, and Riverdale neighborhoods. The BRT stop locations would be at 103rd Street, 111th Street, Kensington Avenue, and 130th Street. The following subsections describe the existing land uses within ½ mile of the alignment and proposed bus stops. Appendix A contains detailed bus stop area land use maps.

95th Street Terminal to 99th Street

The adjacent land uses for the BRT Alternative alignment from the 95th Street Terminal to 99th Street include urban mixed and open space (Abbott Park) uses along 95th Street; and single-family residential and institutional (Harlan Community Academy High School) uses along Michigan Avenue to 99th Street.

Figure 4-2: Existing Land Uses in the Red Line Extention Project Area

103rd Street Stop

Land uses within ½ mile of the 103rd Street stop location include urban mixed, institutional, multi-family residential, and vacant uses along Michigan Avenue; and primarily urban mixed-use along 103rd Street. The majority of uses beyond these two arterials are single-family residential uses. There are several institutions (schools and churches) throughout the stop area.

111th Street Stop

Land uses within ½ mile of the 111th Street stop location include urban mixed, institutional, multi-family residential, and vacant uses along Michigan Avenue north of 111th Street; and primarily dense urban mixed-use along Michigan south of 111th Street. West of Michigan Avenue, land uses along 111th Street include institutional (Roseland Community Hospital), urban mixed, and multi-family residential uses. East of Michigan Avenue, the primary land uses are institutional (Gwendolyn Brooks College Preparatory Academy) and open space (Palmer Park). The majority of land uses beyond the arterials are single-family residential uses and institutions.

Kensington Avenue Stop

There is a substantial overlap in land uses for the 111th Street stop location and the Kensington Avenue stop location north of 115th Street. Land uses along Michigan Avenue include urban mixed, institutional, and vacant land uses. Land uses along 115th Street include single-family residential, institutional, and vacant uses and a limited amount of urban mixed-use. The remainder of the area around the stop location contains a mix of single-family and multi-family residential uses and institutional uses (churches and schools).

Kensington Avenue Stop to 130th Street

South of the 115th Street stop location, the Michigan Avenue corridor contains primarily single-family residential uses. For areas that are within the API but not on Michigan Avenue, the majority of land uses are single-family residential with some institutions and open space. The Metra Electric District Blue Island Branch is parallel to 121st Street; the State Street Metra station is one block west of Michigan Avenue. Closer to 130th Street, there are industrial, transportation, and utility land uses.

130th Street Stop

North of 130th Street, the area within ½ mile of the 130th Street stop is dominated by a utility land use (Metropolitan Water Reclamation District [MWRD]). South of 130th Street, the area within ½ mile of the 130th Street stop location is dominated by single-family residential, multi-family residential, institutional, urban mixed, and open space uses such as the Beaubien Woods Forest Preserve. The BRT Alternative would serve the interior of the Altgeld Gardens public housing community south of 130th Street.

4.1.2 Union Pacific Railroad Rail Alternative

This section describes existing land use conditions for all three UPRR Rail Alternative options: the ROW Option, East Option, and West Option. The alignments for the three options are within 50 feet of each other; therefore, the affected environment analysis would be the same for all three options, except where noted.

The UPRR Rail Alternative would begin at CTA's 95th Street Terminal, continue south and west along the 1-94 and I-57 medians, and transition to the UPRR corridor south to 130th Street. The alignment passes through the Washington Heights, Roseland, West Pullman, and Riverdale neighborhoods. Under this alternative, the stations would be at 103rd Street, 111th Street, Michigan Avenue, and 130th Street (South Station Option or West Station Option).

The following subsections describe the existing land uses adjacent to the alignment and within ½ mile of the proposed station locations, or "station areas," in Segment UA (95th Street Terminal to Michigan Avenue station area) and Segment UB (south of Michigan Avenue station area to 130th Street station area). Appendix A contains detailed station area land use maps.

4.1.2.1 UPRR Rail Segment UA

95th Street Terminal to 99th Street

The alignment for all three UPRR Rail Alternative options would start from CTA's 95th Street Terminal and run within the median of I-94 and I-57. The adjacent land uses are primarily transportation and single-family residential uses beyond the highways.

103rd Street Station Area

Land uses within the 103rd Street station area include industrial, urban mixed, single-family residential, and open space uses along the UPRR ROW, and primarily urban mixed-use along 103rd Street. There are some vacant parcels along both corridors. The remainder of the station area consists of single-family residential uses, several institutional land uses (churches and schools), and a large recreational open space (Fernwood Park).

The UPRR Rail Alternative West Option alignment would be within a linear open space (Fernwood Parkway) along Eggleston Avenue between 99th and 103rd Streets. South of 103rd Street, the West Option alignment would be within urban mixed or vacant land uses. The East Option alignment would be within open space (Wendell Smith Park) and single-family residential land uses between 99th and 103rd Streets. South of 103rd Street, the East Option alignment would be within open space (Block Park), adjacent to the Roseland Pump House, and within single-family residential land uses.

111th Street Station Area

Land uses within the 111th Street station area include industrial, urban mixed, single-family residential, and vacant land uses along the UPRR ROW, and mostly single-family residential with some urban mixed and institutional uses along 111th Street, including Roseland Community

Hospital. The remainder of the station area consists of single-family residential uses, several institutional uses (churches and schools), and limited multi-family residential uses.

The UPRR Rail Alternative East Option alignment would be primarily through single-family residential land uses and a limited amount of industrial and institutional land uses. The West Option alignment would be through urban mixed-use, industrial, and vacant land uses.

Michigan Avenue Station Area

Land uses within the Michigan Avenue station area include urban mixed, single-family residential, open space, and vacant land uses along the UPRR ROW, and primarily urban mixed-use along Michigan Avenue. The remainder of the station area contains a mix of single-family and multi-family residential uses, institutional uses (churches and schools), and urban mixed-use along 119th Street.

The UPRR Rail Alternative East Option alignment would be through urban mixed, vacant, and single-family residential land uses. The West Option alignment would be through urban mixed-use and single-family residential land uses.

4.1.2.2 UPRR Rail Segment UB

Michigan Avenue Station Area to 130th Street Station

Between the Michigan Avenue station and 130th Street station, all three UPRR Rail Alternative options would have alignments through industrial and vacant uses, as well as land uses for transportation, communications, and utilities.

130th Street Station Area

Land uses within the 130th Street station area include utilities (MWRD), transportation (I-94), and industrial land uses north of 130th Street, and single-family residential, institutional, urban mixed-use, and open space (mostly within Altgeld Gardens). According to the *Plan for Transformation* (Chicago Housing Authority 2000), the Altgeld Gardens public housing community contains 1,998 units (approximately 8 percent) of the City's public housing stock (24,773 units).

The South Station Option location would be under the 130th Street bridge overpass to provide direct pedestrian access to/from Altgeld Gardens and Carver Military Academy High School. The West Station Option site would be within MWRD property on the north side of 130th Street across from Altgeld Gardens.

4.1.3 Halsted Rail Alternative

Halsted Street is a major north-south arterial about 1 mile west of I-94 and CTA's 95th Street Terminal. The corridor provides access to the Washington Heights, Roseland, Morgan Park, and West Pullman neighborhoods in the City of Chicago. Station locations would be on Halsted Street at 103rd Street, 111th Street, 119th Street, and Vermont Street. The following subsections describe the existing land uses adjacent to the alignment and within ½ mile of the proposed station locations, or "station areas," in Segment HA (95th Street Terminal to 119th Street station area) and Segment HB (Vermont Street station area). Appendix A contains detailed station area land use maps.

4.1.3.1 Halsted Rail Segment HA

95th Street Terminal to 99th Street

The alignment for the Halsted Rail Alternative from the 95th Street Terminal to 99th Street would be within the median of I-94 and I-57. The adjacent land uses are primarily transportation and single-family residential uses beyond the highways.

103rd Street Station Area

Land uses within the 103rd Street station area include urban mixed-use (primarily one-story retail) and institutional uses along Halsted and 103rd Streets, with a few multi-family residential uses. These arterials also have some vacant parcels. The majority of uses beyond these two arterials are single-family residential uses. Fernwood Park, which is two blocks east of Halsted Street, is a large recreational open space.

111th Street Station Area

Land uses within the 111th Street station area include urban mixed-use (primarily one-story retail) along Halsted Street. A large vacant retail commercial mall is at 115th and Halsted Streets. There is a large warehouse use on 111th Street, west of Halsted Street. The majority of land uses beyond these two arterials are single-family residential uses.

119th Street Station Area

Land uses within the 119th station area include urban mixed-use (primarily one-story retail) along Halsted Street and on 119th Street east of Halsted Street. Some vacant parcels are on these arterials. Large industrial and vacant uses are in the southwest quadrant of the station area, including a solar panel facility along 120th Street. The Metra Electric District Blue Island Branch is parallel to 120th and 122nd Streets, and the West Pullman Metra station is at Halsted Street. The remaining land uses are primarily single-family residential uses.

4.1.3.2 Halsted Rail Segment HB

Vermont Street Station Area

Land uses within the Vermont Street station area include urban mixed-use (primarily one-story retail) along Halsted Street, surrounded by single-family residential uses. The northwest quadrant is within the Village of Calumet Park, including the Cedar Park Cemetery along the west side of Halsted Street and the north side of Burr Oak Street. The far south end of the station area includes the Cal-Sag Channel and open space within the Village of Riverdale.

4.2 Planned Land Uses

The City's zoning designations, along with various area plans, guide future land use development. The City of Chicago does not have a city-wide comprehensive plan with a future land use map.

The same situation exists within the Village of Calumet Park. Therefore, this section describes the zoned land uses within ½ mile of the alignments and features of the build alternatives.

The project area includes a variety of zoning districts designated by the Chicago Zoning Ordinance. Specific zoning districts fall within broader zoning types such as residential, business, commercial, manufacturing, parks and open space, planned development, and planned manufacturing. The general purpose of each zoning type is described below according to the Chicago Zoning Ordinance.

- Residential Districts - Create, maintain and promote a variety of housing opportunities for individual households and maintain the desired physical character of the city's existing neighborhoods.

- Business and Commercial - Accommodate retail, service and commercial uses and ensure that business and commercial-zoned areas are compatible with the character of existing neighborhoods.

- Manufacturing - Accommodate manufacturing, warehousing, wholesale, and industrial uses outside the central area.

- Parks and Open Space - Preserve, protect, and enhance lands set aside for public open space, public parks and public beaches.

- Planned Development - Ensure adequate public review of major development proposals; encourage unified planning and development; promote economically beneficial development patterns that are compatible with the character of existing neighborhoods; ensure a level of amenities appropriate to the nature and scale of the project; allow flexibility in application of selected use and development standards in order to promote creative building design and high-quality urban design; and encourage protection and conservation of natural resources.

- Planned Manufacturing - Foster the city’s industrial base and maintain the city’s diversified economy; strengthen existing manufacturing areas that are suitable in size, location, and character; and encourage industrial investment, modernization, and expansion by providing for stable and predictable industrial environments.

Each district type dictates allowable uses, density standards, parking requirements and other character standards for development with zoning district codes. **Figure 4-3** depicts the zoning classifications within the project area. All zoning district codes within the project area are listed in Table 4-1, including the typical uses and standards within each code.

Figure 4-3: Zoning Classifications in the Red Line Extention Project Area

Table 4-1: Red Line Extension Project Area Zoning District Codes and Associated Standards

Type	Code	Title	Typical Uses	Floor to Area Ratio	Max Height (feet)	Front Setbacks	Mixed-use Allowed	Parking Requirements
Residential	RS	Residential Single-Unit District	Single family detached, two flats	0.50-0.90	30	20 feet or 16% of lot depth, whichever is less	No	1 to 2 per unit
	RT	Residential Two-Flat, Townhouse, and Multi-Unit District	Single family detached, two to three flats, townhomes, multifamily	1.05-1.50	35-42	15 feet or 12% of lot depth, whichever is less	No	1 per unit
	RM	Residential Multi-Unit District	Townhomes, multifamily	1.70-6.60	47-None	15 feet or 12% of lot depth, whichever is less	Yes	1 per unit
Business	B1	Neighborhood Shopping District	Storefront-style shopping, residential dwelling above ground floor	1.20-5.00	38-80	None, or 50% of abutting residential lots	Yes	1 per residential unit; None for first 4,000 square feet, then 2.5 spaces per 1,000 square feet commercial
	B2	Neighborhood Mixed-Use District	Storefront-style shopping, residential dwelling at ground floor,	1.20-5.00	38-80	None, or 50% of abutting residential lots	Yes	1 per residential unit; None for first 4,000 square feet, then 2.5 spaces per 1,000 square feet commercial
	B3	Community Shopping District	Destination and auto-oriented retail and services, residential dwelling above ground floor	1.20-5.00	38-80	None, or 50% of abutting residential lots	Yes	1 per residential unit; None for first 4,000 square feet, then 2.5 spaces per 1,000 square feet commercial

Type	Code	Title	Typical Uses	Floor to Area Ratio	Max Height (feet)	Front Setbacks	Mixed-use Allowed	Parking Requirements
Commercial	C1	Neighborhood Commercial District	Destination and auto-oriented retail and services, residential dwelling above ground floor	1.20-5.00	38-80	None, or 50% of abutting residential lots	Yes	1 per residential unit; None for first 4,000 square feet, then 2.5 spaces per 1,000 square feet commercial
	C2	Motor Vehicle-Related Commercial District	Motor vehicle-related commercial district	1.20-5.00	38-80	None, or 50% of abutting residential lots	Yes	1 per residential unit; None for first 4,000 square feet, then 2.5 spaces per 1,000 square feet commercial
	C3	Commercial, Manufacturing, and Employment District	Commercial, manufacturing uses	1.20-5.00	38-80	None, or 50% of abutting residential lots	No	None for first 4,000 square feet, then 2.5 spaces per 1,000 square feet commercial
Manufacturing	M1	Limited Manufacturing/Business Park District	Low impact manufacturing, wholesaling, and warehousing	1.20-3.00	None	10 feet, or equal to abutting and opposite residential lots	No	1 space per 4 employees
	M2	Light Industry District	Moderate impact manufacturing, wholesaling and warehousing	1.20-3.00	None	None, or equal to abutting and opposite residential lots	No	1 space per 4 employees
	M3	Heavy Industrial District	High impact manufacturing and waste related uses	1.20-3.00	None	None, or equal to abutting and opposite residential lots	No	1 space per 4 employees
Parks and Open Space	POS	Parks and Open Space District	Parks, cemeteries, and open spaces				No	
Planned Development	PD	Planned Development District	Hospitals, Water Plants, Entertainment Grounds	Per district ordinance		Per district ordinance	Yes	Per district ordinance
Planned Manufacturing	PMD	Planned Manufacturing District	Processing assemblies, construction shops	3.00 maximum		None, or equal to abutting and opposite residential lots	No	Based on use

Source: Chicago Zoning Ordinance and Land Use Ordinance, Municipal Code of Chicago, March 14, 2012

The Chicago Zoning Ordinance allows for transit-supportive development patterns that support residential, commercial, and business densities within the RLE station areas. Medium-to-high-density residential areas, neighborhood commercial and mixed-use developments are allowable within the existing codes. These districts have various requirements for minimum lot sizes, lot widths or maximum heights.

Zoning in the project area consists of a mix of residential, office, and commercial space and allows for opportunities for greater density, encouraging transit-supportive, compact urban design. Small building setbacks and street level, pedestrian-oriented buildings are encouraged to enhance pedestrian activity and create a friendly street environment for pedestrian users.

The Ordinance has parking and loading requirements to manage the supply of off-street parking, improving mobility, promoting the use of alternative modes of transportation, supporting existing and new economic development, and enhancing the urban environment surrounding CTA or Metra rail station entrances. Minimum off-street parking ratios are reduced by 50 percent from otherwise applicable standards for rehabilitation or reuse of existing structures within 600 feet of a CTA or Metra rail station entrance for parking regulations within the station areas.

4.2.1 Bus Rapid Transit Alternative

Zoning districts adjacent to the BRT Alternative stop locations are listed in Table 4-2. The northern stop locations (103rd, 111th, and Kensington) would best support transit-supportive development. The 130th Street stop location contains a mix of allowable uses, with the majority heavily reliant on the automobile.

Table 4-2: Bus Rapid Transit Alternative Stop Location Zoning Codes

Type	Code	District Description	103rd	111th	Kensington	130th
Residential	RS	Residential Single-Unit	x	x	x	x
	RT	Residential Two-Flat, Townhouse, and Multi-Unit	x	x	x	
	RM	Residential Multi-Unit	x	x	x	x

4.2.2 Union Pacific Railroad Rail Alternative

Zoning districts within the station areas of all UPRR Rail Alternative options are listed in **Table 4-3**. The zoning profiles of the northern station areas (103rd Street, 111th Street, and 115th Street) would best support transit-supportive development. The 130th Street station option areas contain a mix of allowable uses heavy in business, commercial, and manufacturing with minimal opportunity for mixed-use development.

Table 4-3: Union Pacific Railroad Rail Alternative Station Area Zoning Code Designations

Type	Code	District Description	103rd	111th	115th	130th South	130th West
Residential	RS	Residential Single-Unit	x	x	x	x	x
	RT	Residential Two-Flat, Townhouse, and Multi-Unit	x	x	x

4.2.3 Halsted Rail Alternative

Zoning districts within the Halsted Rail Alternative station areas are listed in **Table 4-4**. As shown below, all four station areas are similar in zoning profiles and would equally support transit-supportive development.

Table 4-4: Halsted Rail Alternative Station Area Zoning Code Designations

Type	Code	District Description	103rd	111th	119th	Vermont
Residential	RS	Residential Single-Unit	x	x	x	x

4.3 Land Use and Economic Development Plans and Policies

In the Chicago metropolitan area, land development is guided by regional planning goals and objectives implemented through local land use plans, economic development plans, and interrelated policies, zoning, and incentives. The land use and economic development plans and policies that are summarized below are applicable to the entire project area, unless otherwise noted for a particular alternative. Relevant transportation plans are discussed in the *Transportation Technical Memorandum*.

4.3.1 Summary of Land Use Plans

4.3.1.1 Chicago Metropolitan Agency for Planning *GO TO 2040* Regional Plan

The CMAP serves as the regional planning body and produced *GO TO 2040* (CMAP 2010) as the comprehensive regional plan to help the seven counties and 284 communities in the Chicago metropolitan area plan together for sustainable growth through mid-century and beyond. The link between transportation and land use is recognized by CMAP as an important element of building livable communities. Notably, the RLE Project is a project of regional significance and is on the list of "fiscally constrained projects."

GO TO 2040 states that "growth that emphasizes access to transit and other transportation alternatives can reduce our reliance on cars, helping to reduce congestion and transportation costs for everyone." It also states that "the public sector cannot create a market for redevelopment where none exists, but it can invest in infrastructure and institute regulatory changes to make redevelopment more viable." Finally, *GO TO 2040* states that "community choices about land use and housing should also emphasize principles that improve livability, such as support for transit, walking, and bicycling."

While *GO TO 2040* talks in broad terms, it prioritizes updating and maintaining the existing transit system over expansion. The regional plan also discusses livability—the ability to access services easily within a community—as a main goal for the region, and specifically discusses how access for disabled populations is an important element towards achieving livability.

GO TO 2040 states that local land use decisions should focus on the interrelationship of transportation, land use, and housing, with an emphasis on development patterns that support the use of public transit and access to jobs. Improving public transit is a central element of the regional plan, and supportive land use planning is needed to make transit work well.

4.3.1.2 Transit-Friendly Development Guide

The *Transit-Friendly Development Guide* (CTA 2009) designates each of the CTA's 144 rail stations with one of seven typologies that are common across the rail system. The designations are intended to shape the public's expectations about potential development while identifying the nearby zoning and infrastructure assets that maximize each station as a community anchor. The CTA's 95th Street Terminal is designated as an "Urban Neighborhood."

4.3.1.3 What Will Your Station Look Like?

What Will Your Station Look Like? (2010) was prepared by Developing Communities Project, Inc. (DCP) in conjunction with CMAP, the Metropolitan Planning Council, and the Center for Neighborhood Technology to summarize a community vision of the proposed RLE Project stations. Nearly 130 residents, stakeholders, and public officials attended a vision session on September 14, 2010 to define their use of the RLE Project, and this report includes a preliminary assessment of station area uses, urban design, and densities produced in conjunction with the local stakeholders.

4.3.1.4 Calumet Area Land Use Plan

The *Calumet Area Land Use Plan* (City of Chicago Department of Planning and Development 2002) provides historical background, vision and goals, and a land use plan for largest industrial area in Chicago. The Calumet area has over 1,000 acres suitable for manufacturing, or almost 60 percent of Chicago's available industrial land. Created simultaneously with the Land Use Plan, the Lake Calumet Industrial Corridor Tax Increment Finance (TIF) District is a key method for the Plan's implementation and covers roughly 12,000 acres. A center for industrial development is the Illinois International Port District, which operates the largest intermodal center in the United States, with over 9 million containers per year (2001). In addition, about 4,000 acres are to be managed as the Calumet Open Space Reserve for wildlife habitat and recreation.

4.3.1.5 City Space: An Open Space Plan for Chicago

The *City Space: An Open Space Plan for Chicago* (City of Chicago, Chicago Park District, and Forest Preserve District of Cook County 1998) is a comprehensive plan for creating and preserving open space throughout the City of Chicago. The Plan has two basic goals for the City: (1) each community needs enough acres of open space available to serve the residents who live there, and (2) residents of every community deserve to have parks or other open spaces that are within reasonable travel distances. The Plan singles out the Lake Calumet area as the City's most substantial wetland and natural area, containing 1,000 acres out of the approximately 3,700 acres within the Forest Preserve District of Cook County.

4.3.2 Summary of Economic Development Plans and Studies

4.3.2.1 Chicago Sustainable Industries: A Manufacturing Work Plan for the 21st Century

The *Chicago Sustainable Industries, Phase One: A Manufacturing Work Plan for the 21st Century* (City of Chicago Department of Housing and Economic Development 2011) is a comprehensive planning initiative to support existing manufacturers, manufacturing sub-sectors, and the city's competitive advantages. In the 1990s, Chicago designated 24 Industrial Corridors to focus its industrial retention efforts. Most of these corridors have multi-modal access, favorable zoning, and TIF financing incentives. Three of the 24 Industrial Corridors are completely or partially within the project area: Calumet, Pullman, and West Pullman.

4.3.2.2 Cook County Comprehensive Economic Development Strategy Report

The Cook County *Comprehensive Economic Development Strategy Report* (Cook County Department of Economic Development 2009) is a cooperative regional approach to business development and retention. The County supports planning and development for new public transit lines and transit-oriented development (TOD). One of the ten regional objectives states that expanding access to public transit is a critical factor in making sure that residents in all areas of the region can access affordable transportation options to get to and from job centers. In addition, 1 of 19 regional strategies is to "join other local, state and national organizations to advocate for and plan new commuter rail options that expand existing rail lines, particularly in areas south, southeast, southwest and northwest in the region," and specifically supports the CTA's Red Line Extension.

4.3.2.3 What Will Your Station Look Like?

As described in Section 4.3.1.3, *What Will Your Station Look Like?* summarizes a community vision of the proposed RLE Project stations, desired station amenities, and ideas for station area development, such as small retail, neighborhood grocery, affordable housing, and a bank. Conceptual station area plans for the 103rd, 111th, 115th, and 130th stations were developed in a visioning session with community input. Based on public feedback, the proposed station on the east (i.e., the South Station Option) was preferred by the local community for the 130th Street station.

4.3.2.4 130th Street Station Market/Access Study

The *130th Street Station Market/Access Study* (Chicago Department of Transportation [CDOT] 2010) built upon the CTA's RLE Alternatives Analysis and examined TOD opportunities for the 130th Street station options. The study analyzed market potential, identified development options, evaluated overall accessibility, and provided station concept plans and a vision statement. The study provides information to support the land use and economic development ratings of the FTA's New Starts Program.

4.3.2.5 Transit Equity Matters

*Transit Equity Matters: A Regional Analysis of the Red Line and Two Other proposed CTA Transit Line Extensions (*Voorhees Center, University of Illinois at Chicago 2009) evaluates the RLE Project relative to the CTA's Orange and Yellow line extensions. The study compared these projects using a regional Equity Index with 19 indicators based on transportation equity, environmental justice, and livability. In summary, the RLE Project would affect a high priority area for transit investment with a score of 32 out of a possible 38 points. The RLE Project would also support the U.S. Department of Transportation-Housing and Urban Development-Environmental Protection Agency Interagency Partnership for Sustainable Communities and its livability principles. The TOD opportunities are also evaluated according to the FTA's New Starts criteria.

4.3.2.6 The Case for Transit-Oriented Development in the Greater Roseland Area

The Case for Transit-Oriented Development in the Greater Roseland Area (Voorhees Center, University of Illinois at Chicago 2005) is a report produced for DCP as part of its efforts to promote the RLE Project, to link jobs and economic development, and pursue TOD in Greater Roseland. Specifically, the report focuses on the proposed Michigan Avenue station and the context for future development, with a focus on unmet consumer demand, available vacant land, and potential land uses.

4.3.2.7 Improving Access, Increasing Livability: The CTA Red Line South Extension

Improving Access, Increasing Livability: The CTA Red Line South Extension (CMAP 2012) highlights the livability impacts of the RLE Project and provides a quantitative analysis of its benefits for the Greater Roseland Area. This report also provides data on station area existing conditions in anticipation of future development, as well as projected changes in commute times, access to jobs, and access to community amenities.

4.3.2.8 Chicago Housing Authority Plans

Plan Forward: Communities That Work (Chicago Housing Authority [CHA] 2013) is the latest plan for public housing in Chicago. The new plan takes as its starting point the successes and lessons of the *Plan for Transformation* (CHA 2000; see description below). According to *Plan Forward*, "CHA's new approach accounts for recent economic uncertainty and changing market conditions, reconsiders existing strategies, and develops forward-thinking, creative policies that will help people and communities prosper. It identifies how CHA will work to fulfill its existing commitments, and sets forth how the agency, with a wide array of partners, will provide housing that promotes the health and vitality of neighborhoods and plays the positive role that it can in people's lives, and how it will assist residents along a path to greater economic independence."

Plan for Transformation (CHA 2000) is a long-term plan to rehabilitate or redevelop the entire stock of public housing in Chicago. According to the plan, the City's public housing stock in 2000 was 38,776 units. After the plan's completion, the City will have approximately 25,000 remaining units. The plan calls for the demolition of high-rise developments, the rehabilitation of scattered-site, senior and lower-density family properties, and the construction of new mixed-income developments. Relative to the RLE Project and the UPRR Alternative, CHA has invested $250 million in renovations within Altgeld Gardens and has plans to renovate more units. Altgeld Gardens contains approximately 2,000 units, or 8 percent of the City's projected public housing stock of 25,000 units.

4.3.3 Summary of Transit-Supportive Policies

As described in Sections 4.3.1 and 4.3.2, the City of Chicago has a number of transit-supportive plans and studies that relate to the project area. These plans contain numerous policies that could serve as a catalyst for transit-supportive development if one of the RLE build alternatives is constructed. The following subsections summarize these transit-supportive policies, as well as related programs, according to the criteria established by the FTA New Starts Program that could provide federal funding for the RLE Project.

4.3.3.1 Growth Management

The growth management factors that influence transit-supportive development include (1) regional policies to concentrate development around established activity centers and transit, and (2) local plans, zoning, and capital improvement programs that support the regional policies. Another factor that influences transit-supportive development relates to regional policies on land conservation and management. The relevant growth management policies for the project area are summarized below.

Concentration of Development around Established Activity Centers and Regional Transit

- CMAP's *GO TO 2040* (2010) is the region's first comprehensive long-range plan. The plan addresses livability through land use and housing, TOD strategies, and new transit investments. Notably, the RLE Project is a highlighted project of regional significance and on the list of fiscally constrained projects.

- The *Cook County Comprehensive Economic Development Strategy Report* (2009) promotes a regional objective to expand access to public transit as an affordable transportation option to and from job centers. This report also promotes regional strategies to use TOD as a green development tool and to expand existing rail lines, including CTA's Red Line Extension.

- CTA's *Transit-Friendly Development Guide* (2009) is a site planning tool for future transit-supportive development. All CTA stations were designated into one of the following station typologies: major activity center, local activity center, dense urban neighborhood, urban neighborhood, service employment district, and manufacturing employment district. General design guidelines are provided for each station type, parking, connectivity, and placemaking. A development guidelines matrix simplifies all recommendations into one spreadsheet.

- The Regional Transportation Authority (RTA) has financial and budget oversight of the CTA, Pace (suburban buses), and Metra (commuter trains), and has a history of promoting TOD through planning and policies. The RTA's *Moving Beyond Congestion Strategic Plan* (2007) supports TOD and specifically calls for the regional transit system to integrate transit investments with local and regional planning processes and to integrate funding with TOD.

- The Center for Neighborhood Technology and its partner, the Center for Transit-Oriented Development, developed a planning tool called the Housing + Transportation Affordability Index (H+T Index) that measures the affordability of housing by factoring in both housing and transportation costs for a specific neighborhood. First developed in 2008, this planning tool can be used to promote more affordable housing choices by leveraging existing infrastructure.

Land Conservation and Management

- Reaching back to the Burnham Plan of 1909, CMAP's *GO TO 2040* (2010) promotes a regional green infrastructure network that follows waterway corridors, expands existing preserves, and creates new preserves. The plan specifically recommends the preservation of an additional 150,000 acres of land across the seven county regions within the next 30 years.

- The City of Chicago's *Calumet Area Land Use Plan* (2001) calls for the redevelopment of 1,000 acres of vacant industrial land (60 percent of the city's available industrial land), while at the same time restoring and preserving about 4,000 acres as the Calumet Open Space Reserve.

- The *City Space: An Open Space Plan for Chicago* (1998) singles out the Lake Calumet area as the City's most substantial wetland and natural area. The proposed 130th Street station could provide access to this area via a bus transfer.

4.3.3.2 Transit-Supportive Corridor Policies

According to the FTA New Starts guidelines, the transit corridor planning process should include a substantial focus on land use planning and may involve conceptual plans, local plans, and capital improvement programs. The factors that determine the influence of transit-supportive corridor policies include (1) plans and policies to increase corridor and station area development; (2) plans and policies to enhance transit-friendly character of corridor and station area development; (3) plans to improve pedestrian facilities and facilities for persons with disabilities; and (4) parking policies. The relevant corridor plans and policies for the project area are summarized below.

Plans and Policies to Increase Corridor and Station Area Development

- *What Will Your Station Look Like?* (2010) is a report that summarizes a community vision session on the RLE Project and potential station area development including infill, density, land uses, parking, streetscape improvements, and conceptual plans and renderings.

- The *130th Street Station Market/Access Study* (2010) analyzes the proposed station options for the 130th Street station relative to the FTA's New Starts criteria. The study includes conceptual station area plans with access and land use recommendations.

- *Transit Equity Matters: A Regional Analysis of the Red Line and Two Other proposed CTA Transit Line Extensions (*2009) evaluates the RLE Project using a regional Equity Index with 19 indicators based on transportation equity, environmental justice, and livability. In addition, TOD potential for the 103rd Street, 111th Street, Michigan Avenue, and 130th Street stations is evaluated according to the following FTA New Starts criteria: development potential of land; transit-supportive plans and policies; and economic climate.

- *The Case for Transit-Oriented Development in the Greater Roseland Area* (2005) is a report that supports the RLE Project, promotes better access to jobs and economic development, and evaluates TOD at the proposed Michigan Avenue station.

Plans and Policies to Enhance Transit-Friendly Character of Corridor and Station Area Development

- The CDOT's "Model Block Program" allocates money for sidewalk improvements by ward. Each alderman can use this fund to build or reconstruct sidewalks in the community.

- Halsted Street has recently undergone a number of streetscape improvements, including street resurfacing, streetscaping, and a landscaped median.

Plans to Improve Pedestrian Facilities and Facilities for Persons with Disabilities

- The *Chicago Pedestrian Plan* (CDOT 2012) was developed by CDOT with collaboration with the Mayor's Pedestrian Advisory Council to identify new opportunities and ongoing initiatives that will strengthen Chicago's pedestrian environment. Chicago has double the national average for hit and run pedestrian fatalities; therefore, the City has set a goal to reduce pedestrian fatalities to zero over the next ten years. The tools for safer streets and action items for short-, mid-, and long-term implementation are key elements of the Plan.

- The Mayor's Office for People with Disabilities coordinates the planning and installation of all sidewalk ramp projects in the city.

- The CTA/CDOT "Walk to Transit" is a program designed to add and improve pedestrian connections and accessibility at transit stations.

- The CDOT Pedestrian Program is the primary lead on pedestrian issues and has a wide range of programs directed toward improving safety and activity, including Safe Streets for Chicago, Safe Routes Ambassadors, Safe Routes to Schools, Walk to Transit, Safe Routes for Seniors, WalkChicago!, pedestrian fatality investigations, and education initiatives.

- Safe Streets for Chicago is a citywide initiative to improve safety on city streets, particularly related to pedestrian safety. One recent effort was crosswalk enforcement to alert motorists that they must yield to pedestrians in crosswalks.

- The City of Chicago has a Complete Streets policy to design the entire roadway ROW to accommodate all users: pedestrians, bicyclists, motorists, and transit users.

- The CDOT Streetscape program is charged with enhancing the public way to support the revitalization of commercial corridors. Enhancing the pedestrian environment is one of the goals. The City has published Streetscape Guidelines.

Parking Policies

- Within the Chicago Zoning Ordinance, specific parking requirements are included for transit-served locations. In B, C, or D districts, minimum off-street parking ratios are reduced by 50 percent from otherwise applicable standards for rehabilitation or reuse of existing structures within 600 feet of a CTA or Metra rail station entrance.

- The Chicago Zoning Ordinance states that bicycle parking must be provided in accordance with the off-street parking ratios. The Zoning Code provides details on design and location.

- The CTA has a program to install bicycle parking at rail stations.

- The terminal station is proposed to include parking facilities with approximately 2,300 spaces in the year 2030. Intermediate stations at 103rd and 111th Streets are proposed to include approximately 200 parking spaces, while the 119th Street (Halsted Rail) and the Michigan Avenue (UPRR Rail) stations are proposed to include approximately 1,000 spaces by 2030.

4.3.3.3 Supportive Zoning Regulations Near Transit Stations

Zoning establishes a framework for future development. According to the FTA, existing and proposed zoning should allow transit-supportive densities and uses, incentives to increase station area development, provisions to enhance transit-supportive character and pedestrian access, and provisions for reduced parking. The relevant zoning regulations and provisions for the project area are summarized below.

Zoning Ordinances that Support Increased Development Density in Transit Station Areas

- Existing zoning along the corridor and around station areas is transit-supportive. Floor area bonuses are included in the Chicago Zoning Ordinance. These are intended to provide an economic incentive for developers to provide affordable housing and public amenities that improve the quality of life for city residents, employees, and visitors, and are a benefit to the public. Specific menu items are included in the Ordinance that relate to transit-supportive actions, include public plazas, sidewalk widening, streetscape improvements, transit station improvements, and concealed parking.

Zoning Ordinances that Enhance Transit-Oriented Character of Station Area Development

- The Chicago Zoning Ordinance and Land Use Ordinance address "Pedestrian Streets." The regulations of this section are intended to preserve and enhance the character of streets and intersections that are widely recognized as Chicago's best examples of pedestrian-oriented shopping districts. The regulations are intended to promote transit, economic vitality, and pedestrian safety and comfort. While Halsted Street or Michigan Avenue south of downtown Chicago has not been designated as a Pedestrian Street, they contain some of the relevant characteristics. As TOD occurs around station areas, either corridor could receive this designation.

Zoning Allowances for Reduced Parking and Traffic Mitigation

- The Chicago Zoning Ordinance and Land Use Ordinance address Parking and Zoning. In B, C, or D districts, minimum off-street parking ratios are reduced by 50 percent from the otherwise applicable standards for rehabilitation or reuse of existing structures within 600 feet of a CTA or Metra rail station entrance.

4.3.3.4 Tools to Implement Land Use Policies

According to the FTA, the availability and effectiveness of tools for transit agencies and local jurisdictions to implement transit-supportive policies are as important as the plans and policies. Outreach to government agencies and the community, regulatory and financial incentives, and efforts to engage developers are primary tools to facilitate transit-supportive development. The relevant tools to implement land use policies within the project area are summarized below.

Outreach to Government Agencies and the Community in Support of Land Use Planning

- *Improving Access, Increasing Livability: The CTA Red Line South Extension* (CMAP 2012) highlights the livability impacts of the RLE Project and provides a quantitative analysis of its benefits to the Greater Roseland Area. CMAP launched its Local Technical Assistance program, through which it provides planning and grant assistance to advance the principles of *GO TO 2040*. Through the Local Technical Assistance program, DCP, CTA, CMAP, and Loyola University Chicago's Center for Urban Research and Learning worked to better understand how the proposed Red Line South Extension to 130th Street would affect the livability of the Greater Roseland area and the region as a whole. Substantial input from the local community was recorded through 15 focus groups and 20 interviews, with a goal of reaching approximately 175 community stakeholders.

- CMAP's *GO TO 2040* (2010) is the region's first comprehensive long-range plan. The planning process entailed an extensive outreach program to solicit input from local municipalities, agencies, civic groups, private sector interests, and the general public. The RLE Project is a highlighted project of regional significance and on the list of "fiscally constrained projects."

- *What Will Your Station Look Like?* (2010) summarizes a community vision meeting facilitated by DCP, in conjunction with CMAP, Metropolitan Planning Council, and the Center for Neighborhood Technology. Nearly 130 residents, stakeholders and public officials attended the meeting to define station area development and land uses.

- The *130th Street Station Market/Access Study* (2010) analyzes the proposed station options for the 130th Street station relative to the FTA's New Starts criteria. The study includes conceptual station area plans with access and land use recommendations. The study was produced with input from residents of Altgeld Gardens and the non-profit DCP.

- The RTA's Community Planning Program provides funding for local planning projects that focus on TOD and local transit improvements. The RTA program provided funding for *Transit Equity Matters: A Regional Analysis of the Red Line and Two Other proposed CTA Transit Line Extensions* (2009), which among other topics evaluated the TOD potential for the 103rd Street, 111th Street, Michigan Avenue, and 130th Street stations. The RTA, CTA, and DCP were key participants.

- *The Case for Transit-Oriented Development in the Greater Roseland Area* (2005) provides a vision for TOD at the proposed Michigan Avenue station. The report was produced with substantial input from the non-profit DCP, which is a local community group representing businesses, residents, and institutions.

Regulatory and Financial Incentives to Promote Transit-Supportive Development

- As documented in the *Chicago Sustainable Industries* (2011), three industrial corridors are within the project area. New industrial development in these corridors could provide local jobs or could be accessible via the RLE stations with bus transfers. Relevant to the UPRR Rail Alternative, the Pullman Industrial Corridor is off 115th Street, east of Michigan Avenue, and the Lake Calumet Industrial Corridor is off 130th Street, east of I-94. The West Pullman Industrial Corridor is one block west of the Halsted Rail Alternative 119th Street station location. These corridors are the focus of numerous City programs to encourage industrial development and job retention.

- Four TIF districts are within the project area. Funds from TIF districts can be used for capital improvements to support development. The West Pullman TIF and 119th/Halsted TIFs are relevant to the Halsted Rail Alternative corridor. The Lake Calumet Industrial Corridor TIF is relevant to the UPRR Rail Alternative. The Roseland/Michigan TIF is relevant to all build alternatives.

- Portions of the UPRR corridor are within Enterprise Zone 3, and portions of the Halsted Street corridor are within Enterprise Zone 3 and 6.

- The area around 119th Street and Halsted Street was designated as a Redevelopment Project Area in 2001.

Efforts to Engage the Development Community in Station Area Planning & Development

- The City of Chicago is working with a developer (Crown Commercial Real Estate & Development, Inc.) on the Roseland Plaza redevelopment proposal, which would be adjacent to the Michigan Avenue station. The proposal provides for 49,000 square feet of commercial space and includes a grocery store, pharmacy, clothing store, and a bank. The City provided TIF financing of $4,000,000 and land write-down costs of $3,000,000. The developer provided a 25-foot easement for the RLE alignment along the UPRR corridor.

4.3.3.5 Performance of Transit-Supportive Policies

The FTA New Starts guidelines encourage project sponsors, such as the CTA, to demonstrate the relative performance of transit-supportive policies in facilitating development within a proposed project area or within the region. For example, the successful application of policies to facilitate new urbanist developments anywhere in the region is an indicator of the region's potential success in applying transit-supportive policies within the project area. Demonstrated cases of development within the region and station area development proposals in the project area are listed and summarized below.

Demonstrated Cases of Development Affected by Transit-Supportive Policies

- Chicago West Side - Bethel Center at Green Line Pulaski station

- Chicago North Side - Senior housing, parking garage, and Target at Red Line Wilson station

Station Area Development Proposals and Status

The City of Chicago is working with a developer on the Roseland Plaza redevelopment proposal, adjacent to the proposed Michigan Avenue station. The City's Community Development Commission designated the developer in February 2005. The City approved the sale of its land and land write-down costs in May 2009. The developer modified its proposal and received approval of its Planned Development application from the Chicago Plan Commission in October 2011.

4.3.3.6 Plans and Policies to Maintain or Increase Affordable Housing

Any plans and policies to identify and address specific housing affordability needs along the corridor, as well as financial commitments to preserve or build new affordable housing, is an important consideration under newly proposed guidelines for FTA funding. The UPRR Alternative corridor would benefit the Altgeld Gardens public housing community, which has approximately 2,000 units or 8 percent of the City's 25,000 public housing units. CHA has invested $250 million to rehabilitate existing units, and is working to identify future opportunities within Altgeld Gardens.

4.3.3.7 Transit Investment and Regional Land Use

The existing context of a project area, including the availability of developable land and the corridor economic environment, are key factors in determining the likelihood of transit-supportive land use changes in the future due to a major transit investment. These factors also help determine the potential for a major transit investment to influence regional land use patterns. The available vacant land within the ½-mile station areas and corridor economic conditions for each alternative are summarized below.

Adaptability of Station Area Land for Development

The station areas along the UPRR corridor include vacant parcels and abandoned industrial sites, particularly along the railroad and near 115th and 130th Streets. These sites have redevelopment potential for transit-oriented uses.

- 103rd Street station area - 3.6 percent vacant land
- 111th Street station area - 2.3 percent vacant land
- Michigan Avenue station area - 5.5 percent vacant land
- 130th Street - South Option station area - 7.4 percent vacant land
- 130th Street - West Option station area - 5.8 percent vacant land

The station areas along the Halsted corridor include some vacant parcels, particularly near the 119th Street station location. These sites have redevelopment potential for transit-oriented uses.

- 103rd Street station area - 1.3 percent vacant land
- 111th Street station area - 2.6 percent vacant land
- 119th Street station area - 20.6 percent vacant land
- Vermont Street station area - 1.4 percent vacant land

The station areas along the Michigan Avenue corridor include some vacant parcels, particularly near 115th Street. These sites have redevelopment potential for transit-oriented uses.

- 103rd Street station area - 3.0 percent vacant land
- 111th Street station area - less than 0.1 percent vacant land
- Kensington Street station area - 3.9 percent vacant land
- 130th Street station area - 8.2 percent vacant land

Corridor Economic Environment

The overall economy within the project area was affected by the decline in the manufacturing and steel-producing industries in the Lake Calumet area during the 1980s. In addition, the Pullman Company closed down in 1982. Local suppliers and businesses for these industries began to close as well. Thousands of people lost their jobs, so there was less money to spend in the local economy. The economic fallout of this industrial downturn is still felt within the project area; however, the City of Chicago is promoting new development and redevelopment through plans and policies, financial incentives, and interagency initiatives. Consequently, CMAP is projecting growth within all of the alternative corridors of the project area, as summarized below.

- The BRT Alternative alignment would be primarily along the Michigan Avenue corridor. The Michigan Avenue corridor would have steady growth between 2010 Base Year and year 2030 No Build conditions, according to CMAP forecasts. Population growth within the corridor, at 18 percent, would exceed the average population growth within the metropolitan area, at 15 percent. Employment growth would be at its highest rate within the Kensington Avenue stop area, at 28 percent; however, the 111th Street stop area would contain the highest concentration of jobs within the corridor. Table 4-5 contains the quantitative land use and economic development data for the 2010 Base Year and 2030 No Build conditions along the Michigan Avenue corridor.

Note: * Quantitative data for the corridor and for stop area is measured for the area within ½ mile of the alignment.

- Between the 2010 Base Year and 2030 No Build conditions, the UPRR corridor would have population growth and varying employment growth, according to CMAP forecasts. Population growth within the UPRR corridor, at 16 percent, would remain consistent with the average population growth within the metropolitan area, at 15 percent. Employment growth would vary widely throughout the corridor's station areas. Employment changes would range from growth of 53 percent within the 103rd Street station area to a reduction of 35 percent within the 130th Street South Station Option area. The highest concentration of jobs would be within the 111th Street station area. Table 4-6 contains the quantitative land use and economic development data for the 2010 Base Year and 2030 No Build conditions for all UPRR Rail Alternative options.

Note: * Quantitative data for the corridor and for each station or stop area is measured for the area within ½ mile of the alignment.

- The Halsted Street corridor would have slow population growth and substantial employment growth between the 2010 Base Year and 2030 under No Build conditions, according to CMAP forecasts. Population growth within the corridor, at 10 percent, would be below the average population growth within the metropolitan area, at 15 percent. Employment growth within the corridor, at 56 percent, would be well above the metropolitan average at 16 percent. The most substantial growth in employment would be at the 119th Street and Vermont Avenue station areas, with growth rates of 184 percent and 169 percent, respectively. The highest concentration of jobs within the corridor would shift geographically, from 111th Street station to 119th Street station, between 2010 and 2030. Table 4-7 contains the quantitative land use and economic development data for the 2010 Base Year and 2030 No Build conditions for the Halsted Rail Alternative along the Halsted Street corridor.

Section 5
Impacts and Mitigations

For the purpose of this analysis, the impacts and mitigations discussion has been organized into three impact categories—permanent, construction, and cumulative—with references to affected neighborhoods (see Figure 4-1). Permanent impacts relate to system operations after the project has been constructed, as well as land acquisitions necessary for the permanent ROW. Construction impacts are temporary and would occur for 1 year of construction staging and utility relocations, and for the 3-year construction phase of the project. Cumulative impacts are those of the project combined with other past, present, or foreseeable future projects within the project area.

5.1 No Build Alternative

The No Build Alternative is defined as the existing transportation system plus committed transportation improvements within CMAP's Fiscal Year 2010–2015 TIP, which are included in all alternatives (see *Transportation Technical Memorandum* for TIP improvements). In part, the No Build Alternative serves as a means to compare the benefits and impacts of the build alternatives. Table 5-1 highlights the overall impacts and the following subsections describe the specific impacts for the directly affected neighborhoods.

Table 5-1: Summary of No Build Alternative Impacts*

Phase	Impacts	Washington Heights	Roseland	Morgan Park	West Pullman	Riverdale	Calumet Park
Permanent	Land Use	No Impact	No Impact	No Impact	No Impact	No Impact	No Impact
	Economic Development	No Impact	No Impact	No Impact	No Impact	No Impact	No Impact
Construction	Land Use	No Impact	No Impact	No Impact	No Impact	No Impact	No Impact
	Economic Development	No Impact	No Impact	No Impact	No Impact	No Impact	No Impact
Cumulative	Land Use	No Impact	No Impact	No Impact	No Impact	No Impact	No Impact
	Economic Development	No Impact	No Impact	No Impact	No Impact	No Impact	No Impact

* Impact Categories: Not Applicable (---), Beneficial, No Impact, Not Adverse, Not Substantially Adverse, Adverse

5.1.1 Permanent Impacts - No Build Alternative

5.1.1.1 Land Use

The No Build Alternative would be inconsistent with the goals of CMAP's *GO TO 2040* Plan, which lists the RLE Project as a fiscally constrained project; however, the No Build Alternative would not create any new inconsistencies beyond those that already exist, and would have no impact on land use.

5.1.1.2 Economic Development

The No Build Alternative would be inconsistent with Cook County's *Comprehensive Economic Development Strategy Report,* which supports the Red Line Extension; however, the No Build Alternative would not create any new inconsistencies beyond those that already exist, and would have no impact on the project area with regard to economic development.

5.1.2 Construction Impacts - No Build Alternative

There would be no construction activity as a result of the No Build Alternative, so there would be no impact on land use or economic development.

5.1.3 Cumulative Impacts - No Build Alternative

5.1.3.1 Land Use

When considered with past, present, and reasonably foreseeable projects, land use conditions under the No Build Alternative would remain unchanged and would have no impact.

5.1.3.2 Economic Development

When considered with past, present, and reasonably foreseeable projects, economic development conditions under the No Build Alternative would remain unchanged and would have no impact.

5.2 Bus Rapid Transit Alternative

The BRT Alternative includes a 5.0-mile route from the CTA's 95th Street Terminal, along Michigan Avenue to 130th Street, and through Altgeld Gardens. New bus shelters and park & ride facilities would be constructed near 103rd Street, 111th Street, Kensington Avenue, and 130th Street; therefore, the BRT Alternative would directly affect the Roseland, West Pullman, and Riverdale neighborhoods only. Table 5-2 highlights the overall impacts after mitigation and the following subsections describe the specific impacts for the directly affected neighborhoods. If the alternative would not pass through a neighborhood, the impact category assigned to that neighborhood is "Not Applicable," which is represented by dash marks.

Table 5-2: Summary of Bus Rapid Transit Alternative Impacts after Mitigation*

Phase	Impacts	Washington Heights	Roseland	Morgan Park	West Pullman	Riverdale	Calumet Park
Permanent	Land Use	---	Beneficial	---	Beneficial	Beneficial	---
	Economic Development	---	Not Adverse	---	Not Adverse	Not Adverse	---
Construction	Land Use	---	Not Adverse	---	Not Adverse	Not Adverse	---
	Economic Development	---	Beneficial	---	Beneficial	Beneficial	---

	Economic Development	---	No Impact	---	No Impact	No Impact	---

* Impact Categories: Not Applicable (---), Beneficial, No Impact, Not Adverse, Not Substantially Adverse, Adverse

5.2.1 Permanent Impacts and Mitigations - Bus Rapid Transit Alternative

The BRT Alternative alignment would be primarily along the Michigan Avenue corridor. The Michigan Avenue corridor would have steady growth between the 2010 base year and 2030 with the BRT Alternative, according to CMAP forecasts. With the BRT Alternative, population growth within the corridor, at 20 percent, would exceed the average population growth within the metropolitan area, at 15 percent. Employment growth would be at its highest rate within the 115th Street stop area, at 32 percent; however, the 111th Street stop area would contain the highest concentration of jobs within the corridor. Table 5-3 contains the quantitative land use and economic development data for the 2010 Base Year and 2030 with the BRT Alternative along the Michigan Avenue corridor.

Table 5-3: Quantitative Land Use and Economic Development Data for the Bus Rapid Transit Alternative Alignment*

Data	2010 Base Year	2030 with Bus Rapid Transit Alternative	Growth

Source: Chicago Metropolitan Agency for Planning 2030 Forecast by Subzone, March 22, 2012

Note: * Quantitative data for the corridor and for each station area is measured for the area within ½ mile of the alignment.

5.2.1.1 Land Use

The BRT Alternative would be inconsistent with the region's comprehensive plan, which supports the RLE Project along the UPRR corridor; however, implementation of the BRT Alternative would not create any new inconsistencies beyond those that already exist, would not create an adverse impact on land use, and would provide modest benefits to some neighborhoods.

A limited number of displacements would occur as a result of park & ride lots and parking garages as these facilities are proposed primarily on vacant land. Nevertheless, the Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970 as amended (Uniform Act) guarantees just compensation and relocation assistance for affected residential and business property owners and tenants. With just compensation and relocation assistance per the Uniform Act, these displacement impacts would be considered not adverse due to the availability of similar real estate in the project area and because the land is primarily vacant and underutilized. The park & ride lots and parking garages would be inconsistent with adjacent land uses, and zoning designations do not permit large, stand-alone surface parking lots or parking garages. Mitigation for the parking facilities would include a rezoning and screening, landscaping, and lighting appropriate for adjacent land uses.

Implementation of the BRT Alternative would result in modest travel time savings in the corridor compared to the No Build Alternative. The travel time savings between 95th and 130th Streets would be approximately five minutes when compared to the No Build Alternative (see Table 5-4). The proposed bus stops would improve land use accessibility for local residents who need goods and services from existing businesses in the corridor and need to transfer to the 95th Street Terminal. The proposed park & ride lots and parking garages would improve multi-modal accessibility for auto, bus, and rail transfers. As a result, existing land uses within the ½-mile area of proposed bus stops would benefit from improved travel times and access to the corridor and the 95th Street Terminal and CTA's regional rail network.

Table 5-4: Summary of Travel Time Saving for All Alternatives

Alternative	Total Travel Time (95th Street to 130th Street)*	Time Savings Compared to the No Build Alternative
No Build Alternative	28 minutes	0 minutes
Bus Rapid Transit Alternative	23 minutes	5 minutes
Union Pacific Railroad Rail Alternative (all options)	14 minutes	14 minutes
Halsted Rail Alternative *	10.5 minutes	17.5 minutes

* Halsted Rail Alternative travel time is calculated from 95th to 129th Streets per the RLE Alternatives Analysis Report

Based on improved land use accessibility and modest travel time savings, the BRT Alternative would be beneficial for the Roseland, West Pullman, and Riverdale neighborhoods.

5.2.1.2 Economic Development

The BRT Alternative would be inconsistent with implementation of local and regional economic development plans that support the RLE Project along the UPRR corridor. The only mitigation to remedy this inconsistency with local and regional plans would be to construct the UPRR Rail Alternative. Because implementation of the BRT Alternative would not create any new inconsistencies beyond those that already exist, the alternative would not create an adverse impact.

As stated in Section 5.2.1.1, a limited number of building acquisitions would occur as a result of park & ride lots and parking garages. Because no existing businesses or industries would be displaced, there would be no adverse impact on property tax revenues. The commercial real estate market would not be adversely affected by these park & ride lots and parking garages due to the availability of other commercial real estate in the corridor.

Implementation of the BRT Alternative would not provide any substantive economic development benefits because it would only include limited stop bus service and parking facilities. The lack of rail transit elements, such as a dedicated travel lane and substantial stations, would limit the economic development benefit of the BRT Alternative relative to the rail alternatives.

Based on the overall impacts, the BRT Alternative would have no impact on economic development in Roseland, West Pullman, and Riverdale compared to the UPRR Rail Alternative.

5.2.2 Construction Impacts and Mitigations - Bus Rapid Transit Alternative

5.2.2.1 Land Use

Construction of the proposed bus stops would occur within the public ROW on sidewalks. Construction of the proposed park & ride lots would occur on land acquired for the project. Due to the isolated site improvements and short timeframe for construction, the construction impacts of the BRT Alternative would be considered not adverse on existing land uses.

5.2.2.2 Economic Development

There would be isolated temporary disruptions to business and residential access during construction at parcels directly adjacent to the proposed bus stops and park & ride lots. Due to the short timeframe for construction, the construction impacts of the BRT Alternative would be considered not adverse for local economic development.

There would be short-term economic benefits from the creation of construction jobs. The CTA will consider adding incentives or requirements on contractors to encourage hiring of workers from the affected communities. The staff estimate is derived from an approach recommended within *Estimates of Job Creation from the American Recovery and Reinvestment Act of 2009 (May 2009)*, by the President's Council of Economic Advisers.

The methodology identifies an approximate government capital spending amount of $92,000 (in 2009 dollars) that would create or maintain one job-year (one full time job for one calendar year) of employment. This figure was escalated to current (2013) equivalent dollars through use of the US Department of Labor, Bureau of Labor Statistics "CPI Inflation Calculator." The equivalent 2013 government spending amount was calculated as approximately $100,300, with an average annual increase of approximately 2.18% from 2009-2013. The average annual increase was then applied to the 2013 spending level to project equivalent government spending levels required to create one job-year for the forecast years of capital expenditure for RLE Alternative Project Development, construction, and subsequent closeout activities.

The total estimated cost of the BRT Alternative is approximately $36.7 million, which is the year-of-expenditure. The annual capital expenditure for project development and construction activities was forecast by applying an annual inflation rate to the estimated base year cost based on a standard, design-bid-build schedule to meet the proposed opening years of 2017 (revenue operations) and 2022 (parking garage construction). During mobilization and peak construction, up to approximately 213 total jobs would be created by the BRT Alternative. Additionally, CTA is proposing construction of 2,400 structured parking spaces approximately 5 years after opening of BRT service (opening year 2022). The total cost of the additional parking facilities is estimated at $123.5 M in YOE dollars, generating up to approximately 1,009 total jobs during peak mobilization and construction.

5.2.3 Cumulative Impacts and Mitigations - Bus Rapid Transit Alternative

5.2.3.1 Land Use

When considered with past, present, and reasonably foreseeable projects, land use conditions under the BRT Alternative would generally remain unchanged and would have no impact.

5.2.3.2 Economic Development

When considered with past, present, and reasonably foreseeable projects, economic development conditions under the BRT Alternative would generally remain unchanged and would have no impact.

5.3 Union Pacific Railroad Rail Alternative - Right-of-Way Option

The UPRR Rail Alternative ROW Option (UPRR ROW Option) is a proposed rail extension from the CTA's 95th Street Terminal, along elevated structure within I-94 and 1-57 medians, and then south and southeast along elevated structure within the centerline of the vacated ROW of the UPRR. East of Prairie Avenue, the alignment would cross over Canadian National (CN)/Metra tracks and then transition to an at-grade alignment until its terminus near 130th Street. The UPRR and Amtrak trains would relocate to another corridor as part of a separate and independent project. Rail stations would be at 103rd Street, 111th Street, Michigan Avenue, and 130th Street (West Station Option and South Station Option). The UPRR ROW Option would directly affect the Washington Heights, Roseland, West Pullman, and Riverdale neighborhoods. Table 5-5 highlights the overall impacts after mitigation and the following subsections describe the specific impacts for the directly affected neighborhoods in Segment UA (95th Street to 117th Street) and Segment UB (117th Street to 130th Street). If the alternative would not pass through a neighborhood, the impact category assigned to that neighborhood is "Not Applicable," which is represented by dash marks.

Table 5-5: Summary of Union Pacific Railroad Rail Alternative - Right-of-Way Option Impacts after Mitigation

Phase	Impacts	Washington Heights	Roseland	Morgan Park	West Pullman	Riverdale	Calumet Park
Permanent	Land Use	Beneficial	Beneficial	---	Beneficial	Beneficial	---
	Economic Development	Beneficial	Beneficial	---	Beneficial	Beneficial	---
Construction	Land Use	Not Substantially Adverse	Not Substantially Adverse	---	Not Substantially Adverse	Not Substantially Adverse	---
	Economic Development	Beneficial	Beneficial	---	Beneficial	Beneficial	---
Cumulative	Land Use	Beneficial	Beneficial	---	Beneficial	Beneficial	---
	Economic Development	Beneficial	Beneficial	---	Beneficial	Beneficial	---

* Impact Categories: Not Applicable (---), Beneficial, No Impact, Not Adverse, Not Substantially Adverse, Adverse

5.3.1 Permanent Impacts and Mitigations - Union Pacific Railroad Rail Alternative - Right-of-Way Option

As described in Section 4, the UPRR ROW Option would be consistent with local and regional land use and economic development plans that support the RLE Project along the UPRR corridor to 130th Street. The DCP, with support from project area neighborhoods, has strongly advocated for the RLE Project along the UPRR corridor to 130th Street as a major capital project for the following reasons: to connect residents to regional jobs, shopping, and destinations; to provide a direct connection between affordable housing and regional jobs; to encourage new development and redevelopment near stations; and to improve overall livability in the Greater Roseland Area. The alternative's travel time savings would greatly benefit land use and economic development. The travel time savings between 95th and 130th Streets would be approximately 14 minutes when compared to the No Build Alternative (see Table 5-4). This travel time savings would be the same for all UPRR Rail Alternative options.

Between the 2010 base year and 2030 with the UPRR Rail Alternative, the UPRR corridor would have steady population growth and varying employment growth, according to CMAP forecasts. With the UPRR Rail Alternative, population growth within the UPRR corridor, at 19 percent, would well surpass the average population growth within the metropolitan area, at 15 percent. Employment growth would vary widely throughout the corridor's station areas. Changes in employment would range from a growth of 56 percent within the 103rd Street station area to a reduction of 34 percent within the 130th Street South Station Option area. The highest concentration of jobs would be within the 111th Street station area. Table 5-6 contains the quantitative land use and economic development data for the 2010 Base Year and 2030 Build conditions for all UPRR Rail Alternative options.

Table 5-6: Quantitative Land Use and Economic Development Data for Union Pacific Railroad Rail Alternative Alignments*

Source: Chicago Metropolitan Agency for Planning 2030 Forecast by Subzone, March 22, 2012
Notes: * Quantitative data for the corridor and for each station area is measured for the area within ½ mile of the alignment. UPRR = Union Pacific Railroad.

The following subsections focus on more localized beneficial and adverse impacts on existing land use and economic development conditions in the project area neighborhoods.

5.3.1.1 Segment UA

5.3.1.1.1 Land Use

Washington Heights

From 95th Street to 99th Street, the alignment would be located within the I-57 median, which is owned and maintained by IDOT. There would be no adverse land use impacts because the UPRR ROW Option would be consistent with the existing transportation land uses in that area. The alignment would cross into and also be within the UPRR corridor, which was previously a transportation land use. Between 99th Street and 103rd Street, the adjacent land use in Washington Heights is a linear open space called Fernwood Parkway. Implementation of the UPRR ROW Option would have impacts on this open space, comparable to those of the UPRR (noise and vibration). Therefore, the impacts would be considered not adverse. A CTA rail station would be at 103rd Street, which would provide improved access to residences and businesses within the ½-mile station area. The northwest quadrant of this station area is within Washington Heights, which would benefit from improved access in the local area and region. Due to the improved access and lack of any land acquisitions, the overall impact on Washington Heights' existing land uses would be considered beneficial.

Roseland

Like the alignment in Washington Heights, the alignment in Roseland would be within the I-94 and I-57 medians and the UPRR corridor; however, the transition between the I-57 median and the UPRR ROW centerline at 99th Street would directly affect the northwest corner of the adjacent open space, called Wendell Smith Park (see *Parklands and Community Facilities Technical Memorandum*). Between 99th Place and 103rd Street, the adjacent land uses are primarily single-family residential. The impacts from implementation of the UPRR ROW Option on these residential areas would be comparable to those of the UPRR (noise and vibration), so the impacts would be considered not adverse.

A CTA rail station would be at 103rd Street, which would provide improved access to existing land uses within the ½-mile station area. A park & ride lot would be located on either side of the station. A limited number of displacements would occur as a result of park & ride lots, as they are proposed primarily on vacant land. With just compensation per the Uniform Act, these impacts would be considered not adverse; however, the park & ride lots would be inconsistent with adjacent land uses, and zoning designations do not permit large, stand-alone surface parking lots. Mitigation for the park & ride lots would include a rezoning and screening, landscaping, and lighting appropriate for adjacent residential land uses and open space.

Between the 103rd Street and 111th Street stations, the UPRR ROW Option alignment is flanked by substantial vacant land and urban mixed uses (commercial and industrial) on the west side and by single-family residential uses, one public utility, one private school, two industrial uses, and vacant land on the east side. The impacts from implementation of the UPRR ROW Option on these land uses would be comparable to impacts from previous activities of the UPRR (noise and vibration), so the impacts would be considered not adverse. In addition, a substation is proposed on vacant land along the west side of the corridor at 105th Street. The substation would be similar in use to other heavy commercial and light industrial uses along the west side; therefore, it would be considered not adverse on existing and adjacent land uses.

A CTA rail station would be at 111th Street, which would provide improved access to existing land uses within the ½-mile station area. A park & ride lot would be located on either side of the station. No displacements would occur as a result of the park & ride lots, as they are proposed on vacant land; therefore, the land use impacts would not be adverse. The park & ride lots would, however, be inconsistent with adjacent land uses, and zoning designations do not permit large, stand-alone surface parking lots. Mitigation for the park & ride lots would include a rezoning and screening, landscaping, and lighting appropriate for adjacent residential land uses. Overall, the impacts from the 111th Street station would be considered beneficial due to improved land use access, new multi-modal access, and reuse of vacant land.

Between 111th and 115th Streets, the UPRR Option alignment is flanked by mostly single-family residential uses on both sides. There are limited amounts of vacant land, industrial, and urban mixed-use. The impacts from implementation of the UPRR ROW Option on these land uses would be comparable to impacts from previous activities of the UPRR (noise and vibration), so the impacts would be considered not adverse.

A CTA rail station would be at Michigan Avenue, which would provide improved access to existing land uses within the ½-mile station area. Roseland's southernmost border is 115th Street, and the land uses north of 115th Street would benefit from improved access. This area includes the mixed-use business district along Michigan Avenues between 113th and 115th Streets, as well as a substantial amount of multi-family residential uses. All of these land uses would receive beneficial impacts from improved access to the Michigan Avenue station and the CTA rail network.

West Pullman

Just north of the Michigan Avenue station, a substation would be on vacant land along the western side of the corridor at Lafayette Street. Although there would be no direct impacts, the substation would be inconsistent with the adjacent single-family residential uses on Lafayette Street. Mitigation would include a rezoning and screening, landscaping, and appropriate architectural design and massing. Based on the mitigation, and considering the land use benefits discussed below, the impact on adjacent residential land uses would be not substantially adverse.

The Michigan Avenue station would provide improved access to existing land uses within the ½-mile station area. West Pullman's northernmost border is 115th Street, and the land uses south of 115th Street would benefit from improved access. This area includes the mixed-use business district along Michigan Avenue between 115th and 120th Streets, and a substantial amount of single-family residential and some multi-family residential uses. In addition, the proposed "Roseland Plaza" commercial development on the eastern side of the corridor would benefit from adjacent access. All of these land uses would receive beneficial impacts from improved access to the Michigan Avenue station and the CTA rail network.

A three-story parking garage with ground-floor retail and community facilities would be on the western side of the corridor and bordered by Michigan Avenue, 116th Street, and State Street. Approximately 19 residences would be displaced by this mixed-use parking garage. With just compensation and relocation assistance per the Uniform Act, these impacts would be considered not substantially adverse due to the availability of residential real estate in the same neighborhood and considering the overall land use benefits to the neighborhood.

Across the street from the garage, single-family residential uses along State Street and 116th Street would be adversely affected by changes to the existing land use character. Although there would be no direct impacts, the mixed-use parking garage would be inconsistent with the single-family residential uses on State Street and 116th Street. Mitigation would include a rezoning and screening, landscaping, and appropriate architectural design and massing. Based on the mitigation, the impact on adjacent residential land uses would be not substantially adverse.

A park & ride lot would be located along Michigan Avenue and 116th Street on the eastern side of the corridor. Because the park & ride lot would affect vacant land and a vacant building, the impacts would be considered not adverse. The park & ride lot would, however, be inconsistent with adjacent land uses, and zoning designations do not permit large, stand-alone surface parking lots. Mitigation for the park & ride lot would include a rezoning and screening, landscaping, and lighting appropriate for adjacent residential land uses.

Between 116th and 117th Streets, the UPRR ROW Option alignment is flanked by mostly single-family residential uses on both sides of the corridor. The impacts from implementation of the UPRR ROW Option on adjacent land uses would be comparable to impacts from previous activities of the UPRR (noise, vibration, and visual), so the impacts would be considered not substantially adverse.

5.3.1.1.2 Economic Development

The UPRR ROW Option would provide beneficial travel time savings to all neighborhoods within the ½-mile station area. The travel time savings would benefit residents that desire improved access to job opportunities within the region, to downtown cultural and recreational events, and to shops and services adjacent to Red Line stations. In addition, travel time savings would benefit the local economy through new opportunities for business or residential development within the station areas. Regional TOD studies conducted by the RTA have shown a correlation between station access, business opportunities, and residential home prices.[1] These new development opportunities are also dependent on local plans, zoning, incentives, and market conditions adjacent to each station.

The following subsections highlight the economic development impacts within the project area neighborhoods that would directly benefit from a new station.

Washington Heights

There would be no acquisitions or displacements associated with the UPRR ROW Option within Washington Heights. The proposed rail station at 103rd Street would improve access for properties within ½ mile of the station. National and local experience has shown that property values tend to increase in proximity to a rail station. As such, residential and commercial properties within Washington Heights could increase in value the closer they are to the 103rd Street station. The extent to which property values would be affected also relates to local plans, policies, incentives, and economic climate, all of which influence property values near rail stations. Also, the new station would increase the potential to attract new residential and/or commercial development. For these reasons, the overall impact on Washington Heights would be considered beneficial for local economic development.

Roseland

As described in Section 5.3.1.1.1, there would be a limited number of property acquisitions related to the park & ride lots at the 103rd and 111th Street stations, and a nearby substation. The conversion of these properties to public use would not adversely affect property tax revenues, because these properties contain vacant land and/or buildings. These property acquisitions would not adversely affect the local commercial real estate market due to the availability of comparable real estate within this neighborhood. As it would be in Washington Heights, the new rail stations could increase property values in relation to their proximity to the stations. Also, the new stations would increase the potential to attract new residential and/or commercial development. Therefore, the overall impact on Roseland would be considered beneficial for local economic development.

West Pullman

As described in Section 5.3.1.1.1, there would be several property acquisitions and displacements related to the substation, three-story mixed-use parking garage, and park & ride lot near the

---

[1] Transit-Oriented Development: The Future of Development (RTA 2011)

Michigan Avenue station. The conversion of these properties to public use would temporarily affect property tax revenues due to the displaced single-family homes; however, the affected families would be offered relocation assistance and the new businesses on the ground floor of the mixed-use parking garage would generate retail tax revenue. These property acquisitions would not adversely affect the local real estate market due to the availability of comparable real estate within this neighborhood. As it would be in Washington Heights and Roseland, the new rail station could increase property values in relation to their proximity to the stations. Also, the new station would increase the potential to attract new residential and/or commercial development, especially after construction of the Roseland Plaza development adjacent to the station. The overall impact would be considered beneficial for local economic development.

5.3.1.2 Segment UB

5.3.1.2.1 Land Use

West Pullman

Between 117th Street and the CN/Metra tracks, the UPRR ROW Option alignment is flanked by mostly single-family residential uses on both sides of the corridor. There is an open space called Kensington Park along the western side, but the alternative would not directly affect it. The impacts from implementation of the UPRR ROW Option on adjacent land uses would be comparable to impacts from previous activities of the UPRR (noise, vibration, and visual), so the impacts would be considered not substantially adverse. There would be one industrial displacement where the UPRR ROW Option transitions from the embankment to an aerial structure over the CN/Metra railroad tracks on the opposite side of Front Avenue. With just compensation per the Uniform Act to the affected landowner and tenants, the direct impact on this industrial use would be considered not adverse.

Riverdale

The UPRR ROW Option alignment would cross the CN/Metra tracks on an aerial structure and then transition to an at-grade alignment within a vacated railroad ROW until the proposed station at 130th Street (South and West Station Options). The adjacent land uses are transportation, utility, industrial, and vacant land, so the alternative would be consistent with existing land use character.

The 130th Street South Station Option would be accessible from both sides of 130th Street. The South Station Option would include a stationhouse, kiss & ride, bus bays, and seven-story parking garage on the north side of 130th Street, all of which would require negotiations with MWRD for use of land. The South Station Option would also include an auxiliary entrance on the south side of 130th Street, which would provide direct pedestrian access to and from the Altgeld Gardens public housing and the Carver Military Academy High School.

The proposed 130th Street West Station Option would be located along 130th Street directly across the street from Altgeld Gardens, with a new signalized intersection at Evans Avenue. The West Station Option would include a stationhouse, kiss & ride, bus bays, park & ride lot, and four-story parking garage on the north side of 130th Street, which would require negotiations with MWRD for use of land.

The South and West Station Options would equally serve the Altgeld Gardens public housing, which is isolated due to physical boundaries, its geographic position relative to the City, and the surrounding industrial, utility, and transportation land uses. The West Station Option would not only serve Altgeld Gardens, but also the adjacent residential neighborhoods along 130th Street. As is evident from Table 5-6, the West Station Option would serve a larger number of homes and people than the South Station Option. The South Station Option would be at the furthest point east on 130th Street, which would make pedestrian access challenging for half of the residential neighborhoods in this area. The South Station Option would provide easier pedestrian access for Carver High School than the West Station Option.

Both station options would serve as a regional park & ride for commuters using I-94, which would help reduce commuter traffic heading north into Chicago. In addition, the stations would serve as a bus transfer for employees within the Lake Calumet industrial area or visitors to the Lake Calumet nature preserves. Due to improved access for residents, commuters, employees, and visitors, the overall land use impact would be considered beneficial for Riverdale.

5.3.1.2.2 Economic Development

West Pullman

As described in Section 5.3.1.2.1, there would be one industrial displacement associated with the UPRR ROW Option. Due to compensation and relocation assistance within the same neighborhood, the impact would be considered not adverse. The overall economic development impacts for the remaining properties in the ½-mile station area would be considered beneficial, as described in Section 5.3.1.1.2.

Riverdale

As described in Section 5.3.1.2.1, there would be a limited number of property acquisitions related to the 130th Street station and parking facilities. The conversion of these properties to a public use would not adversely affect property tax revenues, because these properties are already tax exempt. Unlike the other proposed stations, the 130th Street station would not increase property values in relation to their proximity to the stations because the closest property is a public housing site. The Chicago Housing Authority supports the RLE Project to 130th Street in order to improve regional job accessibility for the isolated residential population at Altgeld Gardens. The Chicago Housing Authority has reinvested $250 million in residential renovation within Altgeld Gardens, and has plans to renovate more residential units. Lastly, the 130th Street station would be unlikely to increase the potential to attract new residential and/or commercial development due to the limited availability of developable land as well as the isolated nature of this area. This conclusion is supported by the findings of the *130th Street Station Access/Market Study,* which only found support for small retail near the station. Nevertheless, the overall impact on Riverdale would be considered beneficial for local economic development due to improved accessibility to the regional job market and improved access to the Lake Calumet area and communities south of 130th Street.

5.3.2 Construction Impacts and Mitigations - Union Pacific Railroad Rail Alternative - Right-of-Way Option

Construction of the proposed UPRR ROW Option, including construction staging activities, would occur on land acquired for the project's permanent ROW. As such, there would be no acquisition or displacement impacts from construction.

5.3.2.1 Segment UA

5.3.2.1.1 Land Use

Construction would take up to 5 years and would cause temporary impacts on adjacent residential neighborhoods due to noise, vibration, fugitive dust, truck traffic, and roadway detours. Mitigation methods would include daytime construction activities and other best management practices (see *Construction Impacts Technical Memorandum* for more details). Based on these mitigations and the beneficial impacts of the project, the land use impacts from construction would be considered not substantially adverse in the affected neighborhoods: Washington Heights, Roseland, and West Pullman.

5.3.2.1.2 Economic Development

Construction would take up to 5 years and would cause temporary impacts on adjacent commercial uses on Michigan Avenue due to noise, vibration, fugitive dust, truck traffic, and roadway detours. Mitigation methods would include daytime construction activities, commercial signage during detours, and special advertising for businesses within the ½-mile API. Due to mitigation, the construction impacts on existing businesses would be considered not adverse. Construction activities would occur throughout the corridor and would be more extensive than for the BRT Alternative, but would not substantially influence regional construction costs due to the large size of Chicago's construction industry.

There would be short-term economic beneficial impacts from construction jobs. CTA has developed estimates for the number and types of jobs that would be created by the construction of the RLE Project. RLE Project construction is currently not funded and is contingent upon federal approvals and funding availability. However, the possibility of leveraging Federal capital funding programs to reduce the local financing burden has led CTA to incorporate the job creation methodology identified within *Estimates of Job Creation from the American Recovery and Reinvestment Act of 2009 (May 2009)*, by the President's Council of Economic Advisers.

The methodology identifies an approximate government capital spending amount of $92,000 (in 2009 dollars) that would create or maintain one job-year (one full time job for one calendar year) of employment. This figure was escalated to current (2013) equivalent dollars through use of the US Department of Labor, Bureau of Labor Statistics "CPI Inflation Calculator." The equivalent 2013 government spending amount was calculated as approximately $100,300, with an average annual increase of approximately 2.18% from 2009-2013. The average annual increase was then applied to the 2013 spending level to project equivalent government spending levels required to create one job-year for the forecast years of capital expenditure for RLE Alternative Project Development, construction, and subsequent closeout activities.

The job estimates presented are based on the range of YOE (2026) capital costs calculated for the various UPRR alternative alignment and station configuration options, projected at approximately $2.2 billion to $2.3 billion dollars. Any future changes in the project cost or advancement in construction technologies would affect the actual number and types of jobs that would be created. CTA will revise these job estimates as the planning progresses and more or revised information becomes available.

Based on the above considerations, it is estimated that construction of the RLE Project would create approximately 5,180 total jobs during the year with peak mobilization and construction. All construction jobs would be under the General Contractor, who would be selected for this project per CTA's procurement process through competitive bidding. This competitive bidding would happen only after CTA has secured funding and federal approval for all the interim phases and for construction.

Based on the mitigations and the beneficial impacts of the project, the overall economic development impact from construction would be considered beneficial to the Washington Heights, Roseland, West Pullman, and Riverdale neighborhoods.

5.3.2.2 Segment UB

5.3.2.2.1 Land Use

Similar to the impacts and mitigation described in Section 5.3.2.1.1, the land use impacts from construction would be considered not substantially adverse in West Pullman and Riverdale.

5.3.2.2.2 Economic Development

Similar to the impacts and mitigation described in Section 5.3.2.1.2, the economic development impacts from construction would be considered beneficial due to short-term job creation.

5.3.3 Cumulative Impacts and Mitigations - Union Pacific Railroad Rail Alternative - Right-of-Way Option

5.3.3.1 Segment UA

5.3.3.1.1 Land Use

Conditions under the UPRR ROW Option would have a cumulative beneficial impact on those neighborhoods in the project area that are focused on improving employment accessibility to the Chicago region, attracting development adjacent to RLE stations, and improving the overall livability of neighborhoods through local and regional planning. These neighborhoods include Washington Heights, Roseland, and West Pullman. Furthermore, the UPRR ROW Options would only be implemented if the UPRR is relocated as part of a separate, independent project prior to the construction of the UPRR ROW Option. This action will benefit adjacent residential neighborhoods that are relieved of the noise, vibration, and traffic delays caused by the Union Pacific Railroad, and that would benefit from new heavy rail transit services.

5.3.3.1.2 Economic Development

As described in Section 5.2.3.2, the overall economy within the project area was affected by the decline in the manufacturing and steel-producing industries in the 1980s and that the planning and economic development efforts of the City of Chicago and community organizations are showing modest results in the form of new private and public sector investment. For these reasons, implementation of the UPRR ROW Option would have a beneficial cumulative impact on economic development due to new employment accessibility, attraction of new development, and overall livability improvements. The private sector would likely perceive the UPRR ROW Option as a public sector commitment to improve the overall project area and regain confidence in the area's economic development market. The affected neighborhoods include Washington Heights, Roseland, and West Pullman.

5.3.3.2 Segment UB

5.3.3.2.1 Land Use

Similar to the impacts described in Section 5.3.3.1.1, the cumulative land use impacts would be considered beneficial in West Pullman and Riverdale.

5.3.3.2.2 Economic Development

Similar to the impacts described in Section 5.3.3.1.2, the cumulative economic development impacts would be considered beneficial in West Pullman and Riverdale.

5.3.4 120th Street Yard and Shop

A new maintenance yard and shop for 270 train cars would be constructed as part of the RLE Project. The new yard and shop would be built on a combination of industrial and vacant land east of the CN/Metra tracks and west of the Indiana Harbor Belt/Northern Indiana Commuter Transportation District (IHB/NICTD) tracks at approximately 120th Street and Cottage Grove Avenue.

5.3.4.1 Permanent Impacts and Mitigations

5.3.4.1.1 Land Use

The yard and shop would be located within an industrial area; therefore, the facilities would be consistent with existing land uses. The new facilities would require the partial land acquisition of an industrial property, as well as vacant land. With just compensation per the Uniform Act to affected landowners and tenants, the direct impact on existing land uses would be considered not adverse. The maintenance yard would cut off roadway access between contiguous properties of the MWRD property; however, a new road and bridge would be built to maintain connectivity between these properties. The overall land use impacts would not be adverse.

5.3.4.1.2 Economic Development

The yard and shop would partially affect a low-intensity industrial property; therefore, there would be no adverse impacts on local economic development.

5.3.4.2 Construction Impacts and Mitigations

Because the yard and shop would be located in a heavy industrial area, the construction activities would be considered not adverse for land use or economic development. The CTA would coordinate construction activities with MWRD.

5.4 Union Pacific Railroad Rail Alternative - East Option

The UPRR Rail Alternative East Option (UPRR East Option) is a proposed rail extension from the CTA's 95th Street Terminal, along elevated structure within I-94 and 1-57 medians, and then on elevated structure south and southeast along the eastern perimeter of the UPRR. East of Prairie Avenue, the alignment would cross over CN/Metra tracks and then transition to at-grade alignment until its terminus near 130th Street. Rail stations would be at 103rd Street, 111th Street, Michigan Avenue, and 130th Street (West Station Option and South Station Option). The UPRR East Option would directly affect the Washington Heights, Roseland, West Pullman, and Riverdale neighborhoods. Table 5-7 highlights the overall impacts after mitigation and the following subsections describe the specific impacts for the directly affected neighborhoods in Segment UA (95th Street to 117th Street) and Segment UB (117th Street to 130th Street). If the alternative would not pass through a neighborhood, the impact category assigned to that neighborhood is "Not Applicable," which is represented by dash marks.

Table 5-7: Summary of Union Pacific Railroad Rail Alternative East Option Impacts after Mitigation*

Phase	Impacts	Washington Heights	Roseland	Morgan Park	West Pullman	Riverdale	Calumet Park
Permanent	Land Use	Beneficial	Not Substantially Adverse	---	Not Substantially Adverse	Beneficial	---
	Economic Development	Beneficial	Beneficial	---	Beneficial	Beneficial	---
Construction	Land Use	Not Substantially Adverse	Not Substantially Adverse	---	Not Substantially Adverse	Not Substantially Adverse	---
	Economic Development	Beneficial	Beneficial	---	Beneficial	Beneficial	---
Cumulative	Land Use	Beneficial	Beneficial	---	Beneficial	Beneficial	---
	Economic Development	Beneficial	Beneficial	---	Beneficial	Beneficial	---

* Impact Categories: Not Applicable (---), Beneficial, No Impact, Not Adverse, Not Substantially Adverse, Adverse

5.4.1 Permanent Impacts and Mitigations - Union Pacific Railroad Rail Alternative - East Option

The UPRR East Option would be consistent with local and regional land use and economic development plans, as described in Section 4, that support the RLE Project along the UPRR corridor to 130th Street. This option would offer beneficial impacts, as described for the ROW Option in Section 5.3.1. The following subsections focus on more localized beneficial and adverse impacts on existing land use and economic development conditions in the project area neighborhoods.

5.4.1.1 Segment UA

5.4.1.1.1 Land Use

Washington Heights

The alignment would be within the I-94 and I-57 medians and would transition to the eastern perimeter of the UPRR ROW. A new CTA rail station would be at 103rd Street, which would provide improved access to residences and businesses within the ½-mile station area. The northwest quadrant of this station area is within Washington Heights, which would benefit from improved access in the local area and region. Due to the improved access and lack of any land acquisitions or building displacements, the overall impact on Washington Heights' existing land uses would be considered beneficial.

Roseland

The transition between the I-57 median and the UPRR East Option centerline at 99th Street would directly affect the western portion of the adjacent open space called Wendell Smith Park (see *Parklands and Community Facilities Technical Memorandum*).

Between 99th Place and 103rd Street, three or four homes at the end of each block would be displaced by the alternative's proposed ROW and station at 103rd Street. Mitigation for these impacts would include just compensation and relocation assistance, as required by the Uniform Relocation Act. The UPRR East Option also would introduce an elevated rail line adjacent to single-family residential land uses. The impacts from implementation of the UPRR East Option on these land uses would be comparable to those of the UPRR (noise and vibration), so the impacts would be considered not substantially adverse.

The 103rd Street station would provide improved access to existing land uses within the ½-mile station area. The station would be located adjacent to a single-family residential street, a local arterial with commercial and residential uses, and within a portion of Block Park. A park & ride lot on either side of the station's alignment would affect vacant land and a vacant building. With just compensation per the Uniform Act, these impacts would be considered not substantially adverse because the land is vacant and underutilized. The park & ride lots would, however, be inconsistent with adjacent land uses, and zoning designations do not permit large, stand-alone surface parking lots. Mitigation for the park & ride lots would include a rezoning and screening, landscaping, and lighting appropriate for adjacent residential land uses and open space.

Block Park is a passive open space, which would be directly affected by the UPRR East Option; however, the underutilized park could become integrated as a gateway to and from the station and Roseland neighborhood as mitigation for the direct impacts. Additional park amenities or park space elsewhere in the Roseland neighborhood are other mitigation options (see *Parklands and Community Facilities Technical Memorandum*). Overall, the impacts from the 103rd Street station would be considered beneficial due to improved land use access, new multi-modal access, reuse of vacant properties, and reuse of a passive open space.

A substation would be on vacant land along the west side of the UPRR ROW at 105th Street. The substation would be similar in use to other heavy commercial and light industrial uses along the west side; therefore, the impact on existing and adjacent land uses would be considered not adverse.

Between the 103rd and the 111th Streets, a number of homes at the end of each block would be displaced by the alternative's ROW and station at 111th Street. The proposed ROW also would directly affect a private school's open space, two industrial uses, and vacant land. Mitigation for this affected area would be just compensation and relocation assistance. The UPRR East Option also would introduce an elevated rail line adjacent to single-family residential land uses. The impacts from implementation of the UPRR East Option on these land uses would be comparable to those of the UPRR (noise and vibration), so the impacts would be considered not substantially adverse.

The 111th Street station would provide improved access to existing land uses within the ½-mile station area. The station would be located adjacent to single-family residential streets and a local arterial with commercial and residential uses. A park & ride lot would be located on vacant land on either side of the station's alignment. The park & ride lots would be inconsistent with adjacent land uses and zoning. Mitigation for the park & ride lots would include a rezoning and screening, landscaping, and lighting appropriate for adjacent residential land uses. Overall, the impacts from the 111th Street station would be considered beneficial due to improved land use access, new multi-modal access, and reuse of vacant land.

Between 111th and 115th Streets, a number of homes at the end of each block would be displaced by the alternative's proposed ROW, as well as a limited amount of vacant land, industrial uses, and urban mixed uses. Mitigation for this affected area would be just compensation and relocation assistance. The UPRR East Option also would introduce an elevated rail line adjacent to single-family residential land uses. The impacts from implementation of the UPRR East Option on these land uses would be comparable to impacts from the UPRR (noise and vibration), so the impacts would be considered not substantially adverse.

A new CTA rail station would be at Michigan Avenue, which would provide improved access to existing land uses within the ½-mile station area. Roseland's southernmost border is 115th Street, and the land uses north of 115th Street would benefit from improved access. This area includes the mixed-use business district along Michigan Avenue between 113th and 115th Streets, as well as a substantial amount of multi-family residential uses. All of these land uses would receive beneficial impacts from improved access to the Michigan Avenue station and the CTA rail network.

West Pullman

Between 115th and 116th Streets, the UPRR East Option impacts would be similar to those described for the UPRR ROW Option under Section 5.3.1.1.1 with a few exceptions, noted below.

Between 115th and 116th Streets, the UPRR East Option alignment would displace two single-family residential uses. Between State Street and Michigan Avenue, the alignment would be within a negotiated easement area of the proposed Roseland Plaza.

A three-story parking garage with ground-floor retail and community facilities would be located on the western side of the corridor and bordered by Michigan Avenue, 116th Street, and State Street. Approximately 19 residences would be displaced by this mixed-use parking garage. With just compensation and relocation assistance per the Uniform Act, these impacts would be considered not substantially adverse due to the availability of residential real estate in the same neighborhood and considering the overall land use benefits to the neighborhood.

Across the street from the garage, single-family residential uses along State Street and 116th Street would be adversely affected by changes to the existing land use character. Although there would be no direct impacts, the mixed-use parking garage would be inconsistent with the single-family residential uses on State Street and 116th Street. Mitigation would include a rezoning and screening, landscaping, and appropriate architectural design and massing. Based on the mitigation, the impact on adjacent residential land uses would be not substantially adverse.

Between the 1116th and 117th Streets, the alignment would displace a limited number of single-family residential uses and a public use. With just compensation and relocation assistance per the

Uniform Act, the existing land use impact would be considered not substantially adverse. The impacts from implementation of the UPRR East Option on adjacent land uses would be comparable to those of the UPRR (noise, vibration, and visual), so the impacts would be considered not substantially adverse.

5.4.1.1.2 Economic Development

The UPRR East Option would provide beneficial travel time savings and new opportunities for business or residential development within the ½-mile station areas, as described for the UPRR ROW Option in Section 5.3.1.1.2.

Washington Heights

As described in Section 5.4.1.1.1, there would be no acquisitions or displacements associated with the UPRR East Option within Washington Heights. Hence, the UPRR East Option impacts on economic development would be similar to those described for the UPRR ROW Option in Section 5.3.1.1.2.

Roseland

As described in Section 5.4.1.1.1, there would be numerous property displacements related to the UPRR East Option alignment, stations, and park & ride lots at the 103rd and 111th Streets, as well as a nearby substation. The conversion of these properties to public use would temporarily affect property tax revenues due to the displaced single-family homes and businesses; however, the affected families and businesses would be offered relocation assistance within Roseland. These property acquisitions would not adversely affect the local commercial real estate market due to the availability of comparable real estate within this neighborhood. As it would be in Washington Heights, the new rail stations could increase property values in relation to their proximity to the stations. Also, the new stations would increase the potential to attract new residential and/or commercial development. Therefore, the overall impact on Roseland would be considered beneficial for local economic development.

West Pullman

As described in Section 5.4.1.1.1, there would be several property acquisitions and displacements related to the UPRR East Option alignment, three-story mixed-use parking garage, and park & ride lot near the Michigan Avenue station, as well as a nearby substation. The conversion of these properties to public use would temporarily affect property tax revenues due to the displaced single-family homes and businesses; however, the affected families and businesses would be offered relocation assistance and the new businesses on the ground floor of the mixed-use parking garage would generate retail tax revenue. These property acquisitions would not adversely affect the local real estate market due to the availability of comparable real estate within this neighborhood. As it would be in Washington Heights and Roseland, the new rail station could increase property values in relation to their proximity to the stations. Also, the new station would increase the potential to attract new residential and/or commercial development, especially after construction of the Roseland Plaza development adjacent to the station. The overall impact would be considered beneficial for local economic development.

5.4.1.2 Segment UB

5.4.1.2.1 Land Use

As described in Section 5.3.1.2.1, the UPRR East Option impacts would be similar to those described for the UPRR ROW Option for the Riverdale neighborhood. There would be a slight difference in impacts within West Pullman, as noted below.

West Pullman

Between the 117th Street and the CN/Metra tracks, the UPRR East Option alignment would displace a limited number of single-family residential uses, a public use, an industrial use, and vacant land. With just compensation and relocation assistance per the Uniform Act, the impact on existing land uses would be not substantially adverse. The impacts from implementation of the UPRR East Option on adjacent land uses would be comparable to impacts from the UPRR (noise, vibration, and visual), so the impacts would be considered not substantially adverse.

5.4.1.2.2 Economic Development

As described in Section 5.3.1.2.2, the UPRR East Option impacts would be similar to the UPRR ROW Option impacts within the Riverdale neighborhood. There would be a slight difference in impacts within West Pullman, as noted below.

West Pullman

As described in Section 5.4.1.2.1 above, there would be a limited number of displacements in this segment; therefore, the economic development benefits from the UPRR East Option would be similar to those from the UPRR ROW Option described in Section 5.3.1.2.2.

5.4.2 Construction Impacts and Mitigations - Union Pacific Railroad Rail Alternative - East Option

Construction of the proposed UPRR East Option, including construction staging activities, would occur on land acquired for the project's permanent ROW. As such, there would be no acquisition or displacement impacts from construction.

5.4.2.1 Segment UA

5.4.2.1.1 Land Use

The UPRR East Option impacts would be similar to the UPRR ROW Option impacts described in Section 5.3.2.1.1. The overall land use impacts from construction would be not substantially adverse within Washington Heights, Roseland, and West Pullman.

5.4.2.1.2 Economic Development

The UPRR East Option impacts would be similar to the UPRR ROW Option impacts described in Section 5.3.2.1.2. Based on the mitigations and the beneficial impacts of the project, the overall economic development impact from construction would be considered beneficial to the Washington Heights, Roseland, West Pullman, and Riverdale neighborhoods.

5.4.2.2 Segment UB

5.4.2.2.1 Land Use

The UPRR East Option impacts would be similar to the UPRR ROW Option impacts described in Section 5.3.2.2.1. The overall land use impacts from construction would not be adverse within West Pullman and Riverdale.

5.4.2.2.2 Economic Development

The UPRR East Option impacts would be similar to the UPRR ROW Option impacts described in Section 5.3.2.2.2. The overall economic development impacts from construction would be beneficial due to short-term job creation.

5.4.3 Cumulative Impacts and Mitigations - Union Pacific Railroad Rail Alternative - East Option

5.4.3.1 Segment UA

5.4.3.1.1 Land Use

Conditions under the UPRR East Option would have a cumulative beneficial impact on those neighborhoods in the project area that are focused on improving employment accessibility to the Chicago region, attracting development adjacent to RLE stations, and improving the overall livability of neighborhoods through local and regional planning. These neighborhoods include Washington Heights, Roseland, and West Pullman.

5.4.3.1.2 Economic Development

The UPRR East Option impacts would be similar to the UPRR ROW Option impacts described in Section 5.3.3.1.2. The cumulative economic development impacts would be beneficial for the Washington Heights, Roseland, and West Pullman neighborhoods.

5.4.3.2 Segment UB

5.4.3.2.1 Land Use

The UPRR East Option impacts would be similar to the UPRR ROW Option impacts described in Section 5.3.3.2.1. The cumulative land use impacts would be beneficial for the West Pullman and Riverdale neighborhoods.

5.4.3.2.2 Economic Development

The UPRR East Option impacts would be similar to the UPRR ROW Option impacts described in Section 5.3.3.2.2. The cumulative economic development impacts would be beneficial for the West Pullman and Riverdale neighborhoods.

5.4.4 120th Street Yard and Shop

A new yard and shop for 270 train cars would be constructed as part of the RLE Project. The new maintenance yard and shop would be built on a combination of industrial and vacant land east of the CN/Metra tracks and west of the IHB/NICTD tracks at approximately 120th Street and Cottage

Grove Avenue. Impacts and mitigations for this option would be the same as for the ROW Option, described in Section 5.3.4.

5.5 Union Pacific Railroad Rail Alternative - West Option

The Union Pacific Railroad Rail Alternative West Option (UPRR West Option) would be a rail extension from the CTA's 95th Street Terminal, along elevated structure within I-94 and 1-57 medians, and on elevated structure south and southeast along the western perimeter of the UPRR. East of Prairie Avenue, the alignment would cross over CN/Metra tracks and then transition to at-grade alignment until its terminus near 130th Street. Rail stations would be at 103rd Street, 111th Street, Michigan Avenue, and 130th Street (West Station Option and South Station Option). The UPRR West Option would directly affect the Washington Heights, Roseland, West Pullman, and Riverdale neighborhoods. Table 5-8 highlights the overall impacts after mitigation and the following subsections describe the specific impacts for the directly affected neighborhoods in Segment UA (95th Street to 117th Street) and Segment UB (117th Street to 130th Street). If the alternative would not pass through a neighborhood, the impact category assigned to that neighborhood is "Not Applicable," which is represented by dash marks.

Table 5-8: Summary of Union Pacific Railroad Rail Alternative West Option Impacts after Mitigation*

Phase	Impacts	Washington Heights	Roseland	Morgan Park	West Pullman	Riverdale	Calumet Park
Permanent	Land Use	Beneficial	Not Substantially Adverse	---	Not Substantially Adverse	Beneficial	---
	Economic Development	Beneficial	Beneficial	---	Beneficial	Beneficial	---
Construction	Land Use	Not Substantially Adverse	Not Substantially Adverse	---	Not Substantially Adverse	Not Substantially Adverse	---
	Economic Development	Beneficial	Beneficial	---	Beneficial	Beneficial	---
Cumulative	Land Use	Beneficial	Beneficial	---	Beneficial	Beneficial	---
	Economic Development	Beneficial	Beneficial	---	Beneficial	Beneficial	---

* Impact Categories: Not Applicable (---), Beneficial, No Impact, Not Adverse, Not Substantially Adverse, Adverse

5.5.1 Permanent Impacts and Mitigations - Union Pacific Railroad Rail Alternative - West Option

The UPRR West Option would be consistent with local and regional land use and economic development plans, as described in Section 4, that support the RLE Project along the UPRR corridor to 130th Street. This option would offer beneficial impacts, as described for the ROW Option in Section 5.3.1. The following subsections focus on more localized beneficial and adverse impacts on existing land use and economic development conditions in the project area neighborhoods.

5.5.1.1 Segment UA

5.5.1.1.1 Land Use

Washington Heights

The alignment would be within the I-94 and I-57 medians until it transitions to the western perimeter of the UPRR ROW, which would affect a small portion of Wendell Smith Park. Between 99th Street and 103rd Street, the UPRR West Option alignment would cross and directly affect a linear open space called Fernwood Parkway. This open space was utilized for active uses in the early 20th century, but currently exists as a passive green space. The mitigation for the direct impact would include a replacement of open space elsewhere in the neighborhood or project area. Due to the potential mitigation, the overall impact on the existing land use would be considered not substantially adverse (see *Parklands and Community Facilities Technical Memorandum*).

Across the street from Fernwood Parkway, there are approximately 35 single-family homes that front onto Eggleston Avenue and face Fernwood Parkway. This open space essentially serves as a linear buffer for the UPRR. Due to the proposed alignment, the UPRR West Option would affect the adjacent land uses because it is incompatible with single-family residential land uses. Mitigation would include additional street trees along the west side of Eggleston Avenue and an evergreen tree buffer along the east side of Eggleston Avenue. Due to potential mitigation, the overall impact on land uses would be considered not substantially adverse.

A new CTA rail station would be at 103rd Street, which would provide improved access to residences and businesses within the ½-mile station area. The northwest quadrant of this station area is within Washington Heights, which would benefit from improved access in the local area and region. The northern half of the station and primary access would be within Fernwood Parkway, which would be incorporated into the station design as a gateway park space or plaza to the station. Due to the lack of any residential or business displacements, the overall impact on Washington Heights' existing land uses would be considered beneficial due to improved land use access, new multi-modal access, and reuse of a passive open space.

Roseland

The 103rd Street station would provide improved access to existing land uses within the ½-mile station area. The southwest quadrant and eastern half of the station area would be within Roseland, which would benefit from improved access in the local area and region. The southern half of the station and auxiliary access, as well as a park & ride lot, would be on vacant land and a vacant building. With just compensation per the Uniform Act, the displacement impacts would be considered not substantially adverse because the land is vacant and underutilized. The park & ride lot would, however, be inconsistent with adjacent land uses and zoning designations for the adjacent single-family neighborhood. Mitigation for the park & ride lots would include a rezoning and screening, landscaping, and lighting appropriate for adjacent residential land uses. Overall, the impacts from the 103rd Street station would be considered beneficial due to improved land use access, new multi-modal access, and reuse of vacant properties.

A new substation would be located on vacant land along the east side of the UPRR ROW at 105th Street. The substation would be inconsistent with the adjacent single-family residential uses. Mitigation would include a rezoning and screening, landscaping, and appropriate architectural design and massing. Based on the mitigation, the impact on adjacent land uses would be not substantially adverse.

Between the 103rd and the 111th Streets, the UPRR West Option alignment would directly affect a limited number of commercial and industrial uses and a substantial amount of vacant land. In particular, the vacant land is overgrown and sometimes used for illegal dumping. This linear strip of industrial and vacant land is located behind the single-family residences along Eggleston Avenue and is detrimental to the overall quality of this residential neighborhood. With just compensation per the Uniform Act and relocation assistance, the displacement impacts would be considered not substantially adverse, because there is available commercial and industrial land elsewhere in the project area.

The 111th Street station would provide improved access to existing land uses within the ½-mile station area. The station and park & ride lot are proposed for vacant land between 110th Street and 111th Street, a local arterial with commercial and residential uses. The park & ride lot would be inconsistent with adjacent land uses and zoning designations for the adjacent single-family neighborhood. Mitigation for the park & ride lot would include a rezoning and screening, landscaping, and lighting appropriate for adjacent residential land uses. Overall, the impacts from the 111th Street station would be beneficial due to improved land use access, new multi-modal access, and reuse of vacant land.

Between 111th and 115th Streets, the UPRR West Option alignment would directly affect a limited number of single-family residences and businesses, a church property, vacant land, and unused properties of the UPRR (outside the linear railroad ROW). Mitigation for this affected area would be just compensation and relocation assistance. The UPRR West Option also would introduce an elevated rail line adjacent to single-family residential land uses. The impacts from implementation of the UPRR West Option on these land uses would be comparable to impacts from the UPRR (noise and vibration), so the impacts would be considered not substantially adverse.

A CTA rail station would be at Michigan Avenue, which would provide improved access to existing land uses within the ½-mile station area. Roseland's southernmost border is 115th Street, and the land uses north of 115th Street would benefit from improved access. This area includes the mixed-use business district along Michigan Avenue between 113th and 115th Streets, as well as a substantial amount of multi-family residential uses. All of these land uses would receive beneficial impacts from improved access to the Michigan Avenue station and the CTA rail network.

West Pullman

Between 115th and 116th Streets, the UPRR West Option impacts would be similar to those described for the UPRR ROW Option under Section 5.3.1.1.1 with a few exceptions, noted below.

An additional park & ride lot would not be included, as it would be under the UPRR ROW Option and the UPRR East Option. Instead, a five-story parking garage with ground-floor retail and community facilities would be located on the western side of the corridor and bordered by Michigan Avenue, 116th Street, and State Street. The UPRR West Option alignment and northern portion of the Michigan Avenue station would be also located within this affected area. Approximately 19 residences would be displaced by these facilities. With just compensation per the Uniform Act and relocation assistance, these impacts would be considered not substantially adverse due to the availability of residential real estate in the same neighborhood and considering the overall land use benefits to the neighborhood.

Across the street from the garage, single-family residential uses along State Street and 116th Street would be adversely affected by changes to the existing land use character. Although there would be no direct impacts, the mixed-use parking garage would be inconsistent with the single-family residential uses on State Street and 116th Street. Mitigation would include a rezoning and screening, landscaping, and appropriate architectural design and massing such as a “step-back” in the facade to help minimize the height of the garage. Based on the mitigation, the impact on adjacent residential land uses would be not substantially adverse.

Between 115th and 116th Streets, the UPRR West Option alignment and southern portion of the Michigan Avenue station would displace one residential property and vacant land. The impacts from implementation of the UPRR West Option on adjacent land uses would be comparable to impacts from the UPRR (noise, vibration, and visual), so the impacts would be considered not substantially adverse.

5.5.1.1.2 Economic Development

The UPRR West Option would provide beneficial travel time savings and new opportunities for business or residential development within the ½-mile station areas, as described for the UPRR ROW Option in Section 5.3.1.1.2. The following subsections highlight the economic development impacts within the project area neighborhoods that would directly benefit from a new station.

Washington Heights

As described in Section 5.5.1.1.1, there would be no acquisitions or displacements associated with the UPRR West Option within Washington Heights. Hence, the UPRR West Option economic development impacts would be beneficial and similar to those described for the UPRR ROW Option in Section 5.3.1.1.2 and for the UPRR East Option in Section 5.4.1.1.2.

Roseland

As described in Section 5.5.1.1.1, there would be numerous property displacements related to the UPRR West Option alignment, stations, and park & ride lots at the 103rd and 111th Streets, as well as a nearby substation. The conversion of these properties to public use would temporarily affect property tax revenues due to the displaced single-family homes and businesses; however, the affected residents and businesses would be offered relocation assistance within Roseland. These property acquisitions would not adversely affect the local real estate market due to the availability of comparable real estate within this neighborhood. As it would be in Washington Heights, the new rail stations could increase property values in relation to their proximity to the stations. Also, the new stations would increase the potential to attract new residential and/or commercial development. Therefore, the overall impact on Roseland would be considered beneficial for local economic development.

West Pullman

As described in Section 5.5.1.1.1, there would be numerous property acquisitions and displacements related to the UPRR West Option alignment, Michigan Avenue station, and five-story mixed-use parking garage, as well as a nearby substation. The conversion of these properties to public use would temporarily affect property tax revenues due to the displaced single-family homes and businesses; however, the affected residents and businesses would be offered relocation assistance within West Pullman and the new businesses on the ground floor of the mixed-use parking garage would generate retail tax revenue. These property acquisitions would not adversely affect the local real estate market due to the availability of comparable real estate within this neighborhood. As it would be in Washington Heights and Roseland, the new rail station could increase property values in relation to their proximity to the stations. Also, the new station would increase the potential to attract new residential and/or commercial development, especially after construction of the Roseland Plaza development near the station. The overall impact would be considered beneficial for local economic development in West Pullman.

5.5.1.2 Segment UB

5.5.1.2.1 Land Use

The UPRR West Option land use impacts within the Riverdale neighborhood would be similar to those described for the UPRR ROW Option (Section 5.3.1.2.1) and for the UPRR East Option (5.4.1.2.1). There would be a slight difference in impacts within West Pullman, as noted below.

West Pullman

Between the 117th Street and the CN/Metra tracks, the UPRR West Option alignment would displace a limited number of single-family residential uses, an industrial use, and vacant land. With just compensation and relocation assistance per the Uniform Act, the impact on existing land uses would be not substantially adverse. The impacts from implementation of the UPRR West Option on adjacent land uses would be comparable to those of the UPRR (noise, vibration, and visual), so the impacts would be considered not substantially adverse.

5.5.1.2.2 Economic Development

The UPRR West Option economic development impacts within the Riverdale neighborhood would be similar to those described for the UPRR ROW Option (Section 5.3.1.2.2) and for the UPRR East Option (5.4.1.2.2). There would be a slight difference in impacts within West Pullman, as noted below.

West Pullman

There would be a limited number of displacements in this segment as described in Section 5.5.1.2.1 above; therefore, the economic development benefits from the UPRR West Option would be similar to those described in Section 5.5.1.1.2 for West Pullman.

5.5.2 Construction Impacts and Mitigations - Union Pacific Railroad Rail Alternative - West Option

Construction of the proposed UPRR West Option, including construction staging activities, would occur on land acquired for the project's permanent ROW. As such, there would be no acquisition or displacement impacts from construction.

5.5.2.1 Segment UA

5.5.2.1.1 Land Use

The UPRR West Option impacts would be similar to those described for the UPRR ROW Option (Section 5.3.2.1.1) and for the UPRR East Option (Section 5.4.2.1.1). The overall land use impacts from construction would be considered not substantially adverse within Washington Heights, Roseland, and West Pullman.

5.5.2.1.2 Economic Development

The UPRR West Option impacts would be similar to those described for the UPRR ROW Option (Section 5.3.2.1.2) and for the UPRR East Option (Section 5.4.2.1.2). Based on the mitigations and the beneficial impacts of the project, the overall economic development impact from construction would be considered beneficial to the Washington Heights, Roseland, West Pullman, and Riverdale neighborhoods.

5.5.2.2 Segment UB

5.5.2.2.1 Land Use

The UPRR West Option land use impacts would be similar to those described for the UPRR ROW Option (Section 5.3.2.2.1) and for the UPRR East Option (Section 5.4.2.2.1). The overall land use impacts from construction would be considered not adverse within West Pullman and Riverdale.

5.5.2.2.2 Economic Development

The UPRR West Option economic development impacts would be similar to those described for the UPRR ROW Option (Section 5.3.2.2.2) and for the UPRR East Option (Section 5.4.2.2.2). The overall economic development impacts from construction would be considered not adverse within West Pullman and Riverdale.

5.5.3 Cumulative Impacts and Mitigations - Union Pacific Railroad Rail Alternative - West Option

5.5.3.1 Segment UA

5.5.3.1.1 Land Use

The UPRR West Option cumulative land use impacts would be similar to those described for the UPRR ROW Option (Section 5.3.3.1.1) and for the UPRR East Option (Section 5.4.3.1.1). The cumulative land use impacts would be beneficial for Washington Heights, Roseland, and West Pullman.

5.5.3.1.2 Economic Development

The UPRR West Option cumulative economic development impacts would be similar to those described for the UPRR ROW Option (Section 5.3.3.1.2) and for the UPRR East Option (Section 5.4.3.1.2). The cumulative economic development impacts would be beneficial for Washington Heights, Roseland, and West Pullman.

5.5.3.2 Segment UB

5.5.3.2.1 Land Use

The UPRR West Option cumulative land use impacts would be similar to those described for the UPRR ROW Option (Section 5.3.3.2.1) and for the UPRR East Option (Section 5.4.3.2.1). The cumulative land use impacts would be beneficial for West Pullman and Riverdale.

5.5.3.2.2 Economic Development

The UPRR West Option cumulative economic development impacts would be similar to those described for the UPRR ROW Option (Section 5.3.3.2.2) and for the UPRR East Option (Section 5.4.3.2.2). The cumulative economic development impacts would be beneficial for West Pullman and Riverdale.

5.5.4 120th Street Yard and Shop

A new yard and shop for 270 train cars would be constructed as part of the RLE Project. The new maintenance yard and shop would be built on a combination of industrial and vacant land east of the CN/Metra tracks and west of the IHB/NICTD tracks at approximately 120th Street and Cottage Grove Avenue. Impacts and mitigations for this option would be the same as for the ROW Option, described in Section 5.3.4.

5.6 Halsted Rail Alternative

The Halsted Rail Alternative is a proposed rail extension from the CTA's 95th Street Terminal, along elevated structure within I-94 and 1-57 medians, and then within the median of Halsted Street from 99th Street to 129th Street. New rail stations would be at 103rd Street, 111th Street, 119th Street, and Vermont Avenue. The Halsted Rail Alternative would directly affect the Washington Heights, Roseland, Morgan Park, and West Pullman neighborhoods. Table 5-9 highlights the overall impacts after mitigation and the following subsections describe the specific impacts for the directly affected neighborhoods in Segment HA (95th Street to 120th Street) and

Segment HB (120th Street to 129th Street). If the alternative would not pass through a neighborhood, the impact category assigned to that neighborhood is "Not Applicable," which is represented by dash marks.

Table 5-9: Summary of Halsted Rail Alternative Impacts after Mitigation*

Phase	Impacts	Washington Heights	Roseland	Morgan Park	West Pullman	Riverdale	Calumet Park
Permanent	Land Use	Beneficial	Beneficial	Beneficial	Adverse	---	Beneficial
	Economic Development	Beneficial	Beneficial	Beneficial	Beneficial	---	Beneficial
Construction	Land Use	Not Substantially Adverse	Not Substantially Adverse	Not Substantially Adverse	Not Substantially Adverse	---	Not Substantially Adverse
	Economic Development	Beneficial	Beneficial	Beneficial	Beneficial	---	No Impact
Cumulative	Land Use	Beneficial	Beneficial	Beneficial	Beneficial	---	No Impact
	Economic Development	Beneficial	Beneficial	Beneficial	Beneficial	---	No Impact

* Impact Categories: Not Applicable (---), Beneficial, No Impact, Not Adverse, Not Substantially Adverse, Adverse

5.6.1 Permanent Impacts and Mitigations - Halsted Rail Alternative

The Halsted Street corridor would have slow growth in population and substantial employment growth between the 2010 base year and 2030 with the Halsted Rail Alternative, according to CMAP forecasts. With the Halsted Rail Alternative, population growth within the corridor, at 10 percent, would be below the average population growth within the metropolitan area, at 15 percent. Employment growth within the corridor, at 56 percent, would be well above the metropolitan average at 16 percent. The most substantial growth in employment would be at the 119th Street and Vermont Avenue station areas, with growth rates of 184 percent and 169 percent, respectively. The highest concentration of jobs within the corridor would shift geographically between 2010 and 2030, from 111th Street station to 119th Street station. Table 5-10 contains the quantitative land use and economic development data for the Halsted Street corridor, for the 2010 base year and 2030 with the Halsted Rail Alternative.

Table 5-10: Quantitative Land Use and Economic Development Data for Halsted Rail Alternative Alignment*

Data	2010 Base Year	2030 with Halsted Rail Alternative	Growth
Metropolitan Area			
Total Population	2,653,719	3,056,567	15%
Total Employment	1,241,492	1,439,154	16%
Central Business District			
Total Employment	537,369	629,690	17%

Data	2010 Base Year	2030 with Halsted Rail Alternative	Growth
Employment - Portion of Metropolitan Area	43%	44%	---

Source: Chicago Metropolitan Agency for Planning 2030 Forecast by Subzone, March 22, 2012
Note: * Quantitative data for the corridor and for each station area is measured for the area within ½ mile of the alignment.

5.6.1.1 Segment HA

5.6.1.1.1 Land Use

Like the No Build Alternative (Section 5.1.1.1) and the BRT Alternative (Section 5.2.1.1), the Halsted Rail Alternative would be inconsistent with the region's comprehensive plan, which supports the RLE Project along the UPRR corridor; however, the Halsted Rail Alternative would not create any new inconsistencies beyond those that already exist, and would not create an adverse impact on land uses. The Halsted Rail Alternative would provide similar land use benefits as the UPRR Rail Alternative options: to connect residents to regional jobs, shopping, and destinations; to provide a direct connection between affordable housing and regional jobs; to encourage new development and redevelopment near stations, and to improve overall livability. One of the primary factors for beneficial impacts relates to the alternative's travel time savings, which would contribute to beneficial land use and economic development impacts. The travel time savings between 95th and 129th Streets would be approximately 17.5 minutes when compared to the No Build Alternative (see Table 5-4). This travel time savings would be slightly greater than with the UPRR Rail Alternative options; however, the Halsted Rail Alternative would not have the added benefit of serving the Riverdale neighborhood, including the Altgeld Gardens public housing site. The following subsections focus on more localized beneficial and adverse impacts on existing land use and economic development conditions in the project area neighborhoods.

Washington Heights

From the existing 95th Street Terminal, the Halsted Street Alternative alignment would be in the I-94 and I-57 medians until Halsted Street. At transition from I-57 to Halsted Street, the alignment would directly affect one single-family residence and several mixed-use properties. With just compensation and relocation assistance per the Uniform Act, the impact would be not substantially adverse.

A new substation would be at 101st Street on vacant properties along Halsted Street, adjacent to a church parking lot and single-family residences. Although there would be no direct impacts, the substation would be inconsistent with the adjacent single-family residential uses on Emerald Avenue. Mitigation would include a rezoning and screening, landscaping, and appropriate architectural design and massing. Based on the mitigation, the impact on adjacent residential land uses would be not substantially adverse.

A CTA rail station would be at 103rd Street, which would provide improved access to residences and businesses within the ½-mile station area. The western half and the northeast quadrant of this station area would be within Washington Heights, which would benefit from improved access in the local area and region. A park & ride lot would be located on the northwest corner of Halsted and 103rd Streets, which would directly affect several mixed-use properties. With just compensation and relocation assistance per the Uniform Act, the impact would be not substantially adverse. The park & ride lot would, however, be inconsistent with adjacent single-family residential uses and existing zoning on Green Street. Mitigation for the park & ride lot would include a rezoning and screening, landscaping, and lighting appropriate for adjacent residential land uses. Overall, the impacts from the 103rd Street station would be beneficial due to improved land use access and new multi-modal access.

Roseland

As described above, the 103rd Street station would provide improved access to residences and businesses within the ½-mile station area. The southeast quadrant of this station area would be within Roseland, which would benefit from improved access in the local area and region. Because there would be no residential or business displacements, the overall impact on Roseland's existing land uses would be considered beneficial from improved land use access and new multi-modal access.

A substation would be at 110th Street on vacant properties along Halsted Street, adjacent to commercial uses and single-family residences. Although there would be no direct impacts, the substation would be inconsistent with the adjacent single-family residential uses on Emerald Avenue. Mitigation would include a rezoning and screening, landscaping, and appropriate architectural design and massing. Based on the mitigation, the impact on adjacent residential land uses would be not substantially adverse.

A CTA rail station would be at 111th Street, which would provide improved access to residences and businesses within the ½-mile station area. The eastern half of this station area would be within Roseland, which would benefit from improved access in the local area and region. Because there would be no residential or business displacements, the overall impact on Roseland's existing land uses would be considered beneficial from improved land use access and new multi-modal access.

Morgan Park

As described above, the 111th Street station would provide improved access to residences and businesses within the ½-mile station area. The western half of this station area would be within Morgan Park, which would benefit from improved access in the local area and region. A park & ride lot would be located on the northwest corner of Halsted and 111th Streets, which would directly affect two mixed-use properties. With just compensation and relocation assistance per the Uniform Act, the impact would be not substantially adverse. The park & ride lot would, however, be inconsistent with adjacent single-family residential uses and zoning on Green Street. Mitigation for the park & ride lot would include a rezoning and screening, landscaping, and lighting appropriate for adjacent residential land uses. Overall, the impacts from the 111th Street station would be beneficial due to improved land use access and new multi-modal access.

West Pullman

A new CTA rail station would be at 119th Street, which would provide improved access to residences and businesses within the ½-mile station area. A regional park & ride lot would be located on the southwest corner of Halsted and 119th Streets, which would directly affect numerous mixed-use properties, an industrial property, and vacant land. Because the park & ride lot would be within the West Pullman Industrial Corridor, the park & ride lot would be consistent with adjacent land uses along 119th and 120th Streets. Due to the size of the park & ride lot, there would be an impact on the neighborhood's beautification efforts for the Industrial Corridor. Mitigation for the park & ride lot would include screening, landscaping, and lighting used elsewhere within the Industrial Corridor. Overall, the impacts from the 119th Street station would be beneficial due to improved land use access and new multi-modal access.

A new substation would be located nearby on vacant properties along Halsted Street at 118th Place, adjacent to single-family residences. Although there would be no direct impacts, the substation would be inconsistent with the adjacent single-family residential uses on 118th Place. Mitigation would include a rezoning and screening, landscaping, and appropriate architectural design and massing. Based on the mitigation, the impact on adjacent residential land uses would be not substantially adverse.

5.6.1.1.2 Economic Development

The Halsted Rail Alternative would provide beneficial travel time savings and new opportunities for business or residential development within the ½-mile station areas, as described above for the UPRR Rail Alternative. The following subsections highlight the economic development impacts within the project area neighborhoods that would directly benefit from a new station due to new accessibility for residents and increased foot traffic for businesses.

Washington Heights

As described in Section 5.6.1.1.1, there would be several property displacements related to the Halsted Rail Alternative alignment and park & ride lot at the 103rd Street, as well as a nearby substation. The conversion of these properties to public use would temporarily affect property tax revenues due to the displaced mixed-use (retail/apartments) and commercial businesses; however, the affected rental tenants and businesses would be offered relocation assistance within Washington Heights. These property acquisitions would not adversely affect the local commercial real estate market due to the availability of comparable real estate within this neighborhood. Similar to the UPRR Rail Alternative, the Halsted Rail Alternative could increase property values in relation to their proximity to the 103rd Street station. Also, the new station would increase the potential to attract new residential and/or commercial development. Therefore, the overall impact on Washington Heights would be considered beneficial for local economic development.

Roseland

As described in Section 5.6.1.1.1, there would be several property displacements related to the proposed substation at 110th Street. The conversion of these properties to public use would not affect property tax revenues because the properties are currently vacant. Similar to the UPRR Rail Alternative, the Halsted Rail Alternative could increase property values in relation to their proximity to the 103rd Street and the 111th Street stations. Also, the new stations would increase the potential to attract new residential and/or commercial development. Therefore, the overall impact on Washington Heights would be considered beneficial for local economic development.

Morgan Park

As described in Section 5.6.1.1.1, there would be two property displacements related to the park & ride lot at the 111th Street station. The conversion of these properties to public use would temporarily affect property tax revenues due to the displaced businesses; however, the affected businesses would be offered relocation assistance within Morgan Park. These property acquisitions would not adversely affect the local commercial real estate market due to the availability of comparable real estate within this neighborhood. Similar to the UPRR Rail Alternative, the Halsted Rail Alternative could increase property values in relation to their proximity to the 111th Street station. Also, the new station would increase the potential to attract new residential and/or commercial development. Therefore, the overall impact on Morgan Park would be considered beneficial for local economic development.

West Pullman

As described in Section 5.6.1.1.1, there would be numerous property displacements related to the park & ride lot at the 119th Street station as well as a nearby substation. The conversion of these properties to public use would temporarily affect property tax revenues due to the displaced businesses; however, the affected businesses would be offered relocation assistance within West Pullman. These property acquisitions would not adversely affect the local commercial real estate market due to the availability of comparable real estate within this neighborhood. Similar to the UPRR Rail Alternative, the Halsted Rail Alternative could increase property values in relation to their proximity to the 119th Street station. Also, the new station would increase the potential to attract new residential and/or commercial development. Therefore, the overall impact on West Pullman would be considered beneficial for local economic development.

5.6.1.2 Segment HB

5.6.1.2.1 Land Use

West Pullman

As stated in Section 5.6.1.1, the 119th Street station would provide improved access to residences and businesses within the ½-mile station area. Because there would be no residential or business displacements, the overall impact on West Pullman's existing land uses would be considered beneficial from improved land use access and new multi-modal access.

A new substation would be located nearby on a commercial parking lot along Halsted Street at 126th Street, adjacent to single-family residences. With just compensation per the Uniform Act, the direct impact on the commercial property would be not substantially adverse. The substation would, however, be inconsistent with the adjacent single-family residential uses on Emerald Avenue. Mitigation would include a rezoning and screening, landscaping, and appropriate architectural design and massing. Based on the mitigation, the impact on adjacent residential land uses would be not substantially adverse.

A new CTA rail station would be at Vermont Avenue and Halsted Street, which would provide improved access to residences and businesses within the ½-mile station area. A seven-story mixed-use parking garage with ground-floor retail and community facilities would be located along Vermont Avenue and Halsted, Green, and 128th Streets, which would displace a mixed-use commercial building with several businesses and 11 single-family residences. With just compensation and relocation assistance per the Uniform Act, these impacts would be considered not substantially adverse due to the availability of commercial and residential real estate in the same neighborhood.

Across the street from the garage, single-family residential uses along Vermont Avenue and Green Street would be adversely affected by changes to the existing land use character. Due to the seven-story height of the garage, and because the adjacent single-family residential homes are one-story structures, the impact on existing land use character would be considered adverse.

Village of Calumet Park

As described above, the Vermont Avenue station would provide improved access to residences and businesses within the ½-mile station area. West of Carpenter Street, a small portion of the Village of Calumet Park would receive beneficial access impacts for primarily single-family residential uses. West of Halsted Street and north of 127th Street, the majority of land uses within the Village relate to the Cedar Park Cemetery. Because there would be no residential or business displacements, the overall impact on the Village of Calumet Park's existing land uses would be considered beneficial from improved land use access and new multi-modal access.

5.6.1.2.2 Economic Development

West Pullman

As described in Section 5.6.1.2.1, there would be numerous property displacements related to the mixed-use parking garage at the Vermont Avenue station as well as a nearby substation. The conversion of these properties to public use would temporarily affect property tax revenues due to the displaced single-family homes and businesses; however, the affected families and businesses would be offered relocation assistance within West Pullman. These property acquisitions would not adversely affect the local residential and commercial real estate market due to the availability of comparable real estate within this neighborhood. Similar to the UPRR Rail Alternative, the Halsted Rail Alternative could increase property values in relation to their proximity to the 119th Street station and the Vermont Avenue station. Also, the new stations would increase the potential to attract new residential and/or commercial development. Therefore, the overall impact on West Pullman would be considered beneficial for local economic development.

Village of Calumet Park

As described in Section 5.6.1.2.1, there would be no displacements within the Village of Calumet Park. Therefore, the Halsted Rail Alternative could increase property values in relation to their proximity to the Vermont Avenue station. Also, the new station would increase the potential to attract new residential and/or commercial development on vacant land adjacent to the Little Calumet River. Therefore, the overall impact on the Village of Calumet Park would be considered beneficial for local economic development.

5.6.2 Construction Impacts and Mitigations - Halsted Rail Alternative

Construction of the proposed Halsted Rail Alternative, including construction staging activities, would occur on land acquired for the project's permanent ROW. As such, there would be no acquisition or displacement impacts from construction.

5.6.2.1 Segment HA

5.6.2.1.1 Land Use

Construction would take up to 5 years and would cause temporary adverse impacts on commercial properties along Halsted Street and adjacent residential neighborhoods due to noise, vibration, fugitive dust, truck traffic, and roadway detours. Mitigation methods would include daytime construction activities and other best management practices (see *Construction Impacts Technical Memorandum* for more details). Based on these mitigations and the beneficial impacts of the project, the land use impacts from construction would be considered not substantially adverse in the affected neighborhoods: Washington Heights, Roseland, Morgan Park, and West Pullman.

5.6.2.1.2 Economic Development

Similar to the UPRR Rail Alternative, the Halsted Street Alternative would not substantially influence regional construction costs due to the large size of Chicago's construction industry. Construction would take up to 5 years and would cause temporary adverse impacts on adjacent commercial uses on Halsted Street due to noise, vibration, fugitive dust, truck traffic, and roadway detours. Construction activities would occur throughout the Halsted Street corridor within the median and adjacent travel lane, which would affect travel lane patterns and on-street parking. Mitigation methods would include daytime construction activities, commercial signage during detours, and special advertising for businesses within the ½-mile API (see *Construction Impacts Technical Memorandum* for more details). Due to the nature and size of the small businesses along Halsted Street, some businesses might not be able to maintain their customer base and could potentially lose business from construction-related disruptions. Due to the short-term nature of construction activities, these impacts would be considered not substantially adverse.

There would be short-term economic beneficial impacts from construction jobs. The total estimated YOE (2026) capital cost of the Halsted Alternative is approximately $2.4 billion. Similar to the construction job estimate described for the UPRR Rail Alternative in Section 5.3.2.1.2, the Halsted Rail Alternative would create approximately 5,350 total jobs during the year with peak mobilization and construction.

Based on the mitigations and the beneficial impacts of the project, the overall economic development impact from construction would be considered beneficial to the Washington Heights, Roseland, Morgan Park, and West Pullman neighborhoods.

5.6.2.2 Segment HB

5.6.2.2.1 Land Use

Similar to the impacts and mitigation described in Section 5.6.2.1.1, the land use impacts from construction would be considered not substantially adverse in West Pullman and the Village of Calumet Park.

5.6.2.2.2 Economic Development

Similar to the impacts and mitigation described in Section 5.6.2.1.2, the economic development impacts from construction would be considered adverse in West Pullman. Due to the lack of any businesses on Halsted Street within the Village of Calumet Park, there would be no impact on economic development.

5.6.3 Cumulative Impacts and Mitigations - Halsted Rail Alternative

5.6.3.1 Segment HA

5.6.3.1.1 Land Use

The cumulative land use impacts for the Halsted Rail Alternative would be similar to those described for the UPRR ROW Option (Section 5.3.3.1.1), the UPRR East Option (Section 5.4.3.1.1), and the UPRR West Option (Section 5.5.3.1.1). The cumulative land use impacts would be beneficial for Washington Heights, Roseland, and West Pullman. There would be one difference between the Halsted Rail Alternative and the UPRR Rail Alternative. Morgan Park would be unaffected by the UPRR Rail Alternative, but would receive beneficial impacts as a result of the Halsted Rail Alternative.

5.6.3.1.2 Economic Development

The cumulative economic development impacts for the Halsted Rail Alternative would be similar to those described for the UPRR ROW Option (Section 5.3.3.1.2), the UPRR East Option (Section 5.4.3.1.2), and the UPRR West Option (Section 5.5.3.1.2). The cumulative economic development impacts would be beneficial for Washington Heights, Roseland, and West Pullman. There would be one difference between the Halsted Rail Alternative and the UPRR Rail Alternative. Morgan Park would be unaffected by the UPRR Rail Alternative, but would receive beneficial impacts as a result of the Halsted Rail Alternative.

5.6.3.2 Segment HB

5.6.3.2.1 Land Use

The cumulative land use impacts for the Halsted Rail Alternative would be similar to those described for the UPRR ROW Option (Section 5.3.3.2.1), the UPRR East Option (Section 5.4.3.2.1), and the UPRR West Option (Section 5.5.3.2.1). The cumulative land use impacts would be beneficial for West Pullman. There would be two differences between the Halsted Rail Alternative and the UPRR Rail Alternative. The Village of Calumet Park has not developed a new comprehensive plan, station area plan, or relevant policies that would allow it to benefit more directly from the RLE Project, so there would be no adverse or beneficial cumulative land use impacts.

5.6.3.2.2 Economic Development

The cumulative economic development impacts for the Halsted Rail Alternative would be similar to those described for the UPRR ROW Option (Section 5.3.3.2.2), the UPRR East Option (Section 5.4.3.2.2), and the UPRR West Option (Section 5.5.3.2.2). The cumulative economic development impacts would be beneficial for West Pullman. There would be two differences between the Halsted Rail Alternative and the UPRR Rail Alternative. The Village of Calumet Park has not developed any economic development plans or policies that would allow it to benefit more directly from the RLE Project, so there would be no adverse or beneficial cumulative economic development impacts.

5.6.4 119th Street Yard and Shop

A new maintenance yard and shop for 270 train cars would be constructed as part of the RLE Project. The new maintenance yard and shop would be built on a combination of industrial and vacant land west of Halsted Street between 119th and 120th Streets in the West Pullman Industrial Corridor.

5.6.4.1 Permanent Impacts and Mitigations

5.6.4.1.1 Land Use

The yard and shop, as well as adjacent substation, would be located within an industrial area; therefore, these facilities would be consistent with existing land uses. These new facilities would require the displacement of a several industrial and commercial properties, as well as the acquisition of vacant land. With just compensation and relocation assistance per the Uniform Act, the direct impact on existing land uses would be considered not substantially adverse.

5.6.4.1.2 Economic Development

As described in Section 5.6.4.1.1, there would be several property displacements related to the maintenance yard and shop and adjacent substation. The conversion of these properties to public use would temporarily affect property tax revenues due to the displaced businesses; however, the businesses would be offered relocation assistance within West Pullman. These property acquisitions would not adversely affect the local real estate market due to the availability of comparable real estate within this neighborhood. In addition, the City has been working to redevelop the vacant and cleared site of the former Sherman Williams factor within the West Pullman Industrial Corridor, so these new facilities would be considered beneficial to the City's economic development effort. Because compensation and relocation assistance would mitigate displacement impacts, the overall impact on West Pullman would be considered beneficial for local economic development from redevelopment of vacant land and the development of a new industrial facility that would provide new job opportunities to local residents.

5.6.4.2 Construction Impacts and Mitigations

Construction of the proposed yard and shop, including construction staging activities, would occur on land acquired for the yard's permanent ROW. As such, there would be no acquisition or displacement impacts from construction. Because the maintenance yard and shop would be located in an industrial area, the construction activities would be considered not adverse for land use or economic development.

Section 6
Impacts Remaining After Mitigation

This section describes the permanent impacts of the RLE Project remaining after mitigating for impacts as described in Section 5.

6.1 No Build Alternative

There would be no adverse impacts on land use or on economic development as a result of the No Build Alternative.

6.2 Bus Rapid Transit Alternative

There would be no adverse impacts on land use or on economic development as a result of the BRT Alternative.

6.3 Union Pacific Railroad Rail Alternative - Right-of-Way Option

6.3.1 Segment UA

After mitigation, there would be no remaining adverse impacts on land use or on economic development from the UPRR ROW Option.

6.3.2 Segment UB

After mitigation, there would be no remaining adverse impacts on land use or on economic development from the UPRR ROW Option.

6.3.3 120th Street Yard and Shop

After mitigation, there would be no remaining adverse impacts on land use or on economic development from the 120th Street yard and shop.

6.4 Union Pacific Railroad Rail Alternative - East Option

6.4.1 Segment UA

After mitigation, there would be no remaining adverse impacts on land use or on economic development from the UPRR East Option.

6.4.2 Segment UB

After mitigation, there would be no remaining adverse impacts on land use or on economic development from the UPRR East Option.

6.4.3 120th Street Yard and Shop

After mitigation, there would be no remaining adverse impacts on land use or on economic development from the 120th Street yard and shop.

6.5 Union Pacific Railroad Rail Alternative - West Option

6.5.1 Segment UA

After mitigation, there would be no remaining adverse impacts on land use or on economic development from the UPRR West Option.

6.5.2 Segment UB

After mitigation, there would be no remaining adverse impacts on land use or on economic development from the UPRR West Option.

6.5.3 120th Street Yard and Shop

After mitigation, there would be no remaining adverse impacts on land use or on economic development from the 120th Street yard and shop.

6.6 Halsted Rail Alternative

6.6.1 Segment HA

After mitigation, there would be no remaining adverse impacts on land use or on economic development from the Halsted Rail Alternative within this segment.

6.6.2 Segment HB

There would be adverse impacts remaining after mitigation due to the Vermont Avenue mixed-use parking garage within a single-family residential area in West Pullman.

Due to the recent and current planning efforts, as well as the overall economic decline in the project area since the 1980s, there would be adverse cumulative impacts as a result of the Halsted Rail Alternative on the Riverdale neighborhood, which would not be connected by this alternative.

6.6.3 119th Street Yard and Shop

After mitigation, there would be no remaining adverse impacts on land use or on economic development from the 119th Street yard and shop.

Appendix B
2014-2015 Red Line Extension Project Update

2014–2015 Red Line Extension Project Update

From 2012-2014, CTA evaluated benefits and impacts of four alternatives: the No Build Alternative, the Bus Rapid Transit Alternative (along Michigan Avenue), the Union Pacific Railroad (UPRR) Rail Alternative, and the Halsted Alternative. CTA evaluated three options of the UPRR Rail Alternative: Right-of-Way Option, East Option, and West Option. CTA also evaluated two options of the UPRR Rail Alternative 130th Street station: a South Station Option and a West Station Option. Based on the project description provided in Section 2 of this technical memorandum, CTA analyzed the impacts of these alternatives and station options. The benefits and impacts are included in the technical memoranda prepared in 2012-2014.

In August 2014, based on the technical analysis and public input, CTA announced the NEPA Preferred Alternative—the UPRR Rail Alternative. Additional conceptual engineering was conducted on the UPRR Rail Alternative to refine the East and West Option alignments. In addition, CTA is considering only the South Station Option of the 130th Street Station.

In late 2014 and early 2015, CTA conducted additional engineering and revised assumptions on the East and West Options to refine the alignments. The refinement of the East and West Options consisted of the following items:

- For the segment of the alignment along I-57, CTA shifted the proposed alignment from the median of I-57 to the north side of I-57 within the existing expressway right-of-way. The construction would be less complex, safer for construction workers, and have a shorter duration. The shift would also allow for fewer impacts to Wendell Smith Park for the East Option, and would allow for no permanent impacts to Wendell Smith Park for the West Option.

- CTA modified the curve speeds as the alignment heads south from I-57 along the UPRR tracks. The curve speed for both the East and West Options would be 35 mph.

- CTA shifted the East Option alignment near 103rd Street station to minimize impacts to Block Park and the Roseland Pumping Station.

- CTA modified the curves south of 103rd Street for both the East and West Options to 55 mph to maximize the train speed.

- CTA refined the layout of the 120th Street yard and shop to optimize yard operations. The refined layout of the yard would accommodate 340 train cars.

The refinement of the East and West Option alignments minimizes potential impacts to parks while providing flexibility for future design phases. The Draft Environmental Impact Statement contains the benefits and impacts of the refined East and West Option alignments and supersedes information presented in other chapters of this technical memorandum.

The refined East and West Option alignments would have no additional or different impacts from those described in the technical memoranda for the following resource areas: construction, transportation, land use and economic development, historic and cultural resources, safety and security, hazardous materials, indirect and cumulative, air quality, floodplains, vegetation and wildlife habitat, threatened and endangered species, and geology and soils.

Section 1
Summary

This technical memorandum analyzes the potential impacts of displacements and relocations resulting from the Chicago Transit Authority (CTA) Red Line Extension (RLE) Project. Figure 1–1 shows the location of the project alternatives.

According to Federal Transit Administration (FTA) and State of Illinois guidance, displacements and relocations would be considered adverse if they would have one or more of the following results:

- Displacement of substantial numbers of existing housing units (a concentrated number of units in one neighborhood), particularly affordable housing, and/or employer units, necessitating the construction of replacement units elsewhere. This analysis uses the definition of affordable housing provided by the Illinois Housing Development Authority for the Chicago Metro area, which is based on data provided by the U.S. Department of Housing and Urban Development.

- Displacement of a substantial number of residents or employees, necessitating construction of replacement housing or employment locations elsewhere.

The area of potential impact for determining displacement and relocation conflicts for the RLE Project includes parcels within the permanent envelope for each alternative, including the necessary right-of-way (ROW) for the alignment, transit stations, electric substations, parking facilities, and maintenance yards. Each alternative was analyzed for potential displacement impacts on existing parcels and buildings. This analysis determined the following:

- The Bus Rapid Transit (BRT) Alternative would have the fewest impacts, with 52 affected parcels and 3 building displacements, which would be caused by construction of the parking lots and garages. Forty-two of the affected parcels are vacant and/or owned by the City of Chicago.

- The Union Pacific Railroad (UPRR) Rail Alternative ROW Option would have the fewest impacts of the UPRR Rail Alternative options, with 133 affected parcels and 24 building displacements, because the UPRR ROW would be used for most of the elevated alignment. For this analysis, it was assumed that the UPRR trains would relocate to another corridor as part of a separate, earlier project that may occur regardless of RLE implementation and that the current railroad ROW would be publicly owned after freight operations have moved to a new alignment. A total of 18 single-family residences would be displaced, mainly due to construction of the parking garage for the Michigan Avenue station.

- The UPRR Rail Alternative East Option would have the most impacts of all the build alternatives, with 256 affected parcels and 112 building displacements. Eighty-five single-family residences would be displaced from the fully developed neighborhoods along the eastern perimeter of the UPRR. The UPRR Rail Alternative West Option would have fewer impacts (193 affected parcels and 53 building displacements) than the East Option, but more than the ROW Option. The West Option would have fewer impacts on single-family residences (27 displaced single-family residences) than the East Option.

- The Halsted Rail Alternative would have fewer impacts (108 affected parcels and 38 building displacements) than the other rail alternatives. The Halsted Rail Alternative would have the fewest displaced single-family residences (11) and the most displaced commercial buildings (15) of the rail alternatives. The ROW Option would displace 2 commercial buildings, the East Option would displace 3, and the West Option would displace 8.

Federal and state laws require that property owners be paid not less than fair market value for their land and buildings, and that they and their tenants be assisted in finding replacement business sites or dwellings. These protections, compensation, and relocation assistance are guaranteed by the Uniform Relocation and Real Property Assistance Act of 1970, as amended (Uniform Act, 42 United States Code [USC] 4601, et seq.). For displaced residents, the Uniform Act requires that replacement housing must be “decent, safe, and sanitary,” and be functionally equivalent in the number of rooms and living space, location, and general improvements. Replacement dwellings must meet all minimum federal housing requirements and conform to state and local occupancy codes. Relocation assistance will follow the guidelines set forth in Title 49, Part 24 of the Code of Federal Regulations (49 CFR Part 24 and FTA Circular 5010.1C dated October 1, 1998, as amended). Relocation benefits may also be available to businesses and non–profit organizations that may be displaced. Payments may be made for the following: moving costs; tangible personal property loss as a result of relocation or discontinuance of operations; reestablishment expenses; and costs incurred in finding a replacement site. The Uniform Act requires that relocation services and/or payments be made to residential and business owners and to residential and business tenants.

Due to the requirements of the Uniform Act, there would be no adverse impacts remaining after mitigation for the BRT Alternative, UPRR Rail Alternative, or Halsted Rail Alternative. The No Build Alternative is an alternative used for comparative purposes to assess the benefits and impacts of the build alternatives, and there would be no displacements or relocations associated with the No Build Alternative.

Table 1–1 summarizes the displacement impacts by land use type for each RLE alternative. Table 1-2 lists the total number of affected parcels and displacements for each alternative. Table 1-3 lists the overall displacement impacts after mitigation.

Section 2
Project Description

The CTA is proposing to extend the Red Line from the existing 95th Street Terminal to the vicinity of 130th Street, subject to the availability of funding. The proposed RLE would include four stations. Each station would include bus transfer and parking facilities. This project is one part of the Red Ahead Program to extend and enhance the entire Red Line. The CTA is also planning 95th Street Terminal improvements that are anticipated to be completed prior to the proposed RLE construction.

The project area is 11 miles south of the Chicago central business district (commonly referred to as the Loop) and encompasses approximately 20 square miles. The boundaries of the project area are 95th Street on the north, Ashland Avenue on the west, Stony Island Avenue on the east, and the Calumet-Sag Channel/Little Calumet River and 134th Street on the south. The I-57 Expressway and I-94 Bishop Ford Freeway cross the western and eastern edges of the project area, respectively. Lake Calumet is in the eastern portion of the project area. The project area encompasses parts of nine community areas in the City of Chicago and the eastern section of the Village of Calumet Park. Chicago community areas include Beverly, Washington Heights, Roseland, Morgan Park, Pullman, West Pullman, Riverdale, Hegewisch, and South Deering. The project area comprises residential (primarily single family), industrial (both existing and vacant), transportation (including freight), and commercial development.

The Draft Environmental Impact Statement (EIS) focuses on the following alternatives (shown in Figure 2-1), which emerged from the Alternatives Analysis and the National Environmental Policy Act (NEPA) scoping process:

- No Build Alternative
- BRT Alternative
- UPRR Rail Alternative
    - ROW Option
    - East Option
    - West Option
- Halsted Rail Alternative

Utility (MWRD)	Affected Parcel(s)	2	15	15	15	--
	Building Displacement	--	--	--	--	--
Transportation (Railroads)	Affected Parcel(s)	1	11	29	40	7
	Building Displacement	--	1	1	1	--
Public (City of Chicago)***	Affected Parcel(s)	24	59	22	15	18
	Building Displacement	--	--	1	--	2

Notes: BRT = Bus Rapid Transit, UPRR = Union Pacific Railroad, ROW = right-of-way, MWRD = Metropolitan Water Reclamation District
*Building displacements are a subset of affected parcels and relate to a primary building displacement and/or a secondary structure.
**Multi-family residential: All multi-family parcels are single-family homes that have been converted to multi-family homes. The number of multi-family units was determined by counting mailboxes during site visits.
***The publicly owned parcels are considered “affected parcels” and not easements, because the CTA would need to negotiate a fee simple property transfer or an easement with the public entity.

Table 1-2: Quantitative Summary of Displacement Impacts*

Impact	BRT	UPRR Rail ROW Option	UPRR Rail East Option	UPRR Rail West Option	Halsted Rail Option
Affected Parcels	52	133	256	193	108
Building Displacements	3	24	112	53	38

Notes: BRT = Bus Rapid Transit, UPRR = Union Pacific Railroad, ROW = right-of-way
*Building displacement impacts relate to a primary building displacement and/or a secondary structure.

Table 1-3: Overall Displacement Impacts After Mitigation*

Phase	BRT	UPRR Rail ROW Option	UPRR Rail East Option	UPRR Rail West Option	Halsted Rail Option
Operation	Not Adverse	Not Substantially Adverse	Not Substantially Adverse	Not Substantially Adverse	Not Substantially Adverse
Construction	---	---	---	---	---
Cumulative	Not Adverse	Not Adverse	Not Adverse	Not Adverse	Not Adverse

Notes: BRT = Bus Rapid Transit, UPRR = Union Pacific Railroad, ROW = right-of-way
* Impact Categories: Not Applicable (---); No Impact; Not Adverse; Not Substantially Adverse; Adverse

Updated July 29, 2015

In August 2014, based on the technical analysis and public input until then, CTA announced the NEPA Preferred Alternative—the UPRR Rail Alternative. CTA is considering two alignment (route) options of this alternative: the East Option and the West Option. At this time, CTA is also considering only the South Station Option of the 130th Street Station. In late 2014 and early 2015, CTA conducted additional engineering on the East and West Options to refine the East and West Option alignments. Appendix I of this technical memorandum summarizes the refined alignments and any additional or different impacts that would result. The information in Appendix I supersedes information presented in other chapters of this technical memorandum.

The No Build Alternative is a required alternative as part of the NEPA environmental analysis and is used for comparison purposes to assess the relative benefits and impacts of extending the Red Line. The No Build Alternative is carried into the Draft EIS phase of the project development regardless of its performance versus the build alternatives under consideration. No new infrastructure would be constructed as part of the No Build Alternative other than committed transportation improvements that are already in the Chicago Metropolitan Agency for Planning (CMAP) Fiscal Year 2010–2015 Transportation Improvement Program (TIP) and the improvements to 95th Street Terminal. The TIP projects within the project area consist of four bridge reconstructions, several road improvement projects including resurfacing and coordination of signal timing on 95th Street, work on Metra's facilities, construction of a bicycle/pedestrian multi-use trail, and preservation of historic facilities. The No Build Alternative includes regular maintenance of existing track and structures, and bus transit service would be focused on the preservation of existing services and projects. All elements of the No Build Alternative are included in each of the other alternatives. Under this alternative, travel times would not improve from existing conditions.

The BRT Alternative (formerly referred to as the Transportation Systems Management Alternative) is a 5.0-mile, limited-stop, enhanced BRT route, which is assumed to operate 24 hours per day between the existing 95th Street Terminal and the intersection of 130th Street and Eberhart Avenue. No dedicated bus lanes would be provided for the BRT Alternative; however, parking lanes would be removed for some portions of the alignment and four stops with improved bus shelters and park & ride facilities would be created at 103rd Street and Michigan Avenue, 111th Street and Michigan Avenue, Kensington Avenue and Michigan Avenue, and 130th Street and Eberhart Avenue. Although BRT service elements would not continue south of the 130th Street stop, the bus route would continue through Altgeld Gardens along the existing route with six stops. The BRT Alternative would be consistent with bus routing changes that may occur as part of improvements to the 95th Street Terminal. Under this alternative, travel times between 130th Street and the Loop would improve over existing conditions.

The UPRR Rail Alternative is a 5.3-mile extension of the heavy rail transit Red Line from its existing 95th Street Terminal to 130th Street, just west of I-94. The Chicago Transit Board designated the UPRR Rail Alternative as the Locally Preferred Alternative at its August 12, 2009 board meeting. This alternative includes construction and operation of new heavy rail transit tracks, mostly in existing transportation corridors. The UPRR Rail Alternative has three options for alignment (ROW, East, and West), all of which would include operation on elevated structure from 95th Street to just past the Canadian National/Metra Electric District tracks near 119th Street. The alignment would then transition to at-grade through an industrial area with no public through streets, terminating at 130th Street in the vicinity of Altgeld Gardens. Four new stations would be constructed at 103rd Street, 111th Street, Michigan Avenue, and 130th Street. The 130th Street station would be the terminal station, with two options under evaluation: the South Station Option and the West Station Option. A new yard and shop facility would be sited near 120th Street and Cottage Grove Avenue. The bus routes in the vicinity of the UPRR Rail Alternative would be modified to enhance connectivity between the Red Line and the bus network. The hours of operation and service frequency for the UPRR Rail Alternative are assumed to be the same as

for the current Red Line. Under this alternative, travel times between 130th Street and the Loop would improve substantially over existing conditions.

The Halsted Rail Alternative is a 5.0-mile heavy rail transit extension of the existing Red Line. In this alternative, the Red Line would operate on an elevated structure running south from 95th Street along I-57 until Halsted Street. The alignment would then turn south and continue along Halsted Street to the intersection of Halsted Street and Vermont Avenue near 127th Street. This alternative would include four new stations at 103rd Street, 111th Street, 119th Street, and Vermont Avenue. The Vermont Avenue station would be the terminal station. A new yard and shop would be sited west of Halsted Street and between the 119th Street and Vermont Avenue stations. The bus routes in the vicinity of the Halsted Rail Alternative would be modified to enhance connectivity to the Red Line. The hours of operation and service frequency for the Halsted Rail Alternative are assumed to be the same as for the current Red Line. Under this alternative, travel times between 127th Street and the Loop would improve substantially over existing conditions. This alternative would not extend rail to Altgeld Gardens, which would be served by bus connecting to the Vermont terminal station.

Section 3
Methods for Impact Evaluation

3.1 Regulatory Framework

The following sections present brief descriptions of the regulatory framework applicable to the jurisdictions with respect to displacements and relocations within the project area.

3.1.1 Federal

According to the National Environmental Policy Act of 1969 (NEPA) and FTA guidance, the Uniform Act must be implemented if displacements occur as a direct cause of the project. The Uniform Act, as described in Section 1, mandates relocation services and payments for eligible residents, businesses, and non-profit organizations as well as residential and business tenants displaced as a direct result of projects undertaken by a federal agency or with federal financial assistance. The Uniform Act provides equitable land acquisition policies and treatment of persons displaced from their homes and businesses. Owners of private property possess federal constitutional guarantees that their property will not be taken or damaged for public use without just compensation, which is measured by fair market value as determined by the affected property owners and the court.

The Interstate Commerce Commission Termination Act of 1995 created the Surface Transportation Board (STB) and granted the STB exclusive jurisdiction over the regulation of railroad transportation. Pursuant to the Act, approval must be sought from the STB if any form of state or local action, including construction, operation, and/or acquisition, could be used to deny a railroad the ability to conduct some or part of its operations and/or pose undue safety hazards(49 USC 10101 et. seq.).

3.1.2 State and Local

The Illinois Metropolitan Transit Authority Act created the CTA and grants it authority to acquire property by condemnation subject to, and exercised in accordance with, the Illinois Eminent Domain Act. The Illinois Eminent Domain Act sets forth the procedure for acquiring property through condemnation, as well as reimbursements to displaced persons for relocation costs. Relocation costs must be determined methodically as set forth in the Uniform Act described in Section 3.1.1. Similar to the federal regulations, the Illinois state constitution provides owners of private property guarantees regarding takes, damages and just compensation.

3.2 Impact Analysis Thresholds

The FTA's guidance for implementing NEPA states that impacts must be disclosed if land is being acquired for a project and businesses or individuals will be displaced. The FTA's NEPA implementation guidance requires that the characteristics and needs of persons and businesses to be displaced be considered, the available inventory of comparable replacement dwellings and sites be described, and potential relocation problems be discussed. In addition, implementing the policies and procedures required by the Uniform Act and the Illinois Eminent Doman Act (described in Sections 3.1.1 and 3. 1.2) will mitigate displacements that must occur.

As noted in Section 1, the following criteria for determining adverse impacts were used for the purposes of this analysis. These criteria are consistent with FTA and Illinois guidance and the urbanized setting of the project area. Displacements and relocation would be considered adverse if they would have one or more of the following results:

- Displacement of substantial numbers of existing housing units (a concentrated number of units in one neighborhood), particularly affordable housing, and/or employer units, necessitating the construction of replacement units elsewhere. This analysis uses the definition of affordable housing provided by the Illinois Housing Development Authority for the Chicago Metro area, which is based on data provided by the U.S. Department of Housing and Urban Development.

- Displacement of a substantial number of residents or employees, necessitating construction of replacement housing or employment locations elsewhere.

3.3 Area of Potential Impact

For purposes of evaluating the potential displacements and relocation impacts, the area of potential impact was limited to within and directly adjacent to the future ROW needed for each project alternative evaluated as part of the EIS. The Appendix contains figures for parcels affected by the future ROW or permanent envelope of the RLE Project.

3.4 Methods

Existing ROW is determined in coordination with CTA, Chicago Department of Transportation and Illinois Department of Transportation (IDOT). Conceptual engineering drawings prepared for each alternative were used to identify affected parcels and building footprints. In order to ensure a conservative analysis for this EIS, each alternative's displacement impacts were analyzed based on a permanent envelope for the alternative's maximum ROW. Displacement impacts associated with specific project components will be confirmed during the project design process and could be fewer.

Counts and locations of residential and business displacements were prepared using CMAP geographic information system parcel data, Cook County assessor data, aerial photography, and Internet desktop surveys via Google Earth, and field verified for any apparent conflicting information. For instance, CMAP parcel data indicated multi-family land uses but Cook County parcel data simply indicated residential uses without a single-family or multi-family designation. A review of Google Earth aerials and street views showed that CMAP's "multi-family land uses" contain what look like single-family homes. The number of mailboxes at the front door observed during field surveys, however, indicated that some single-family homes had been converted to multi-family homes. U.S. Census data was used for housing and population characteristics. The smallest available Census geography was used for each data component.

The majority of the area surrounding the RLE corridor is urbanized and developed, so there would be multiple displacements as a result of the project. Each alternative was analyzed for potential impacts on parcels resulting from operation. The following definitions were used to define impacts:

- **Easement** - The right to use public property (e.g., roadways) for the permanent envelope would be required. An easement can involve a general or specific portion of the property and can be either at the surface level, or above or beneath the property. Permanent easements would occur for the alignment within the median of public roadways or over public roadways.
- **Affected Parcel** - A partial or a full parcel of private or public property would be required to accommodate the project. This impact would occur if, for example, a portion of a commercial parking lot fronting the alignment is required, but not the adjacent commercial building near the alignment. The result would be a land acquisition, but not a building displacement. If the primary structure were within the ROW, land acquisition and a building acquisition would result. Essentially, building displacements are a subset of affected parcels and relate to a primary building displacement and/or a secondary structure (see description below).
- **Building displacement** - A structure would be within the future ROW. This impact would occur when any primary (e.g., house) or secondary (e.g., garage) structure is required to accommodate the project. On parcels where primary structures would not be acquired and secondary buildings would be affected, only secondary structures would be acquired.

Land use characteristics of affected parcels were consolidated into the following categories: vacant, single-family residential, multi-family residential, mixed-use, commercial, industrial, parks and open space, institutional (school or church), transportation (railroads), and utility (Metropolitan Water Reclamation District [MWRD]), and public. Public uses include any land or buildings owned by the City of Chicago.

Other current and reasonably foreseeable projects and future actions identified as part of the Indirect and Cumulative Impacts analysis were reviewed to determine whether there would be any potential impacts associated with displacements.

For potential displacements identified, the analysis used local real estate information to determine specific replacement or relocation opportunities for affected residential or commercial structures and a site reconnaissance.

Site reconnaissance of the project area and field observation of the parcels potentially acquired fully or partially was undertaken to confirm mapped/secondary source data. Impacts of potential acquisitions on the remainder of the property, on nearby properties, and neighborhoods were evaluated and general relocation opportunities, such as the availability of nearby vacant properties, were identified to assess the mitigation potential. In addition, the impact analyses contained in the *Historical and Cultural Resources Technical Memorandum* and *Land Use and Economic Development Technical Memorandum* were reviewed.

3.4.1 Residential Relocation Impacts

The potential social and financial impacts related to changes in living environments caused by residential relocation impacts were evaluated.

For each residential structure, the estimated number of persons to be displaced was determined by multiplying the estimated number of displaced residential dwelling units in each community area along the alignment by the average number of persons per household in that parcel based on the 2010 U.S. Census data.

Local real estate data, Cook County Assessor data, and U.S. Census data were collected and reviewed to determine the following for local residential household relocations:

- Amount of safe, decent, and sanitary replacement housing or building sites within existing neighborhoods
- Household types (elderly residents, low-income residents, ethnic or racial minority residents, non-English speaking residents)

3.4.2 Business or Community Facility Relocation Impacts

The impact assessment concerning business and community facility relocation used information provided by the City of Chicago and Cook County to determine relocation impacts. These data were used to identify businesses and community facilities, such as hospitals, schools, churches, cemeteries, parks, shopping centers, as well as zoning and land use designations. Data from CMAP and the U.S. Census were used in order to determine the basic economic condition and travel patterns within the project area.

The estimated number of employees displaced was calculated by multiplying affected non-residential building square footage by appropriate employment factors for commercial, office, and industrial development. The name and type of business to be displaced were determined by Cook County parcel data, City of Chicago land use designations, and field research.

Identified business and community facilities were evaluated based on the potential range of impacts for each alternative. The following community components were assessed during the determination of impact:

- Unique or one-of-a-kind community facility that is specific to its location
- Unique or one-of-a-kind business that is specific to its location
- Changes in access (improvements and/or reductions)
- Loss of public lands
- Minority-Owned Business designation

Section 4
Affected Environment

For purposes of this evaluation of property displacements and relocation of existing uses, the affected environment is limited to the areas within and directly adjacent to an alternative's ROW. Figure 4-1 shows the alternatives, the City of Chicago's neighborhoods, and the eastern portion of the Village of Calumet Park. Properties that would be directly affected by the build alternatives are in the following neighborhoods: Washington Heights, Morgan Park, Roseland, West Pullman, and Riverdale. The following subsections describe the existing uses adjacent to the ROW of each build alternative.

4.1 Bus Rapid Transit Alternative

The BRT Alternative is a 5.5-mile, limited-stop, enhanced BRT route that would operate between the existing 95th Street Terminal and the intersection of 130th Street and Eberhart Avenue via 95th Street, Michigan Avenue, 127th Street, Indiana Avenue, and 130th Street. The alignment would cross the Roseland, West Pullman, and Riverdale neighborhoods. Land acquisitions would be required for park & ride lots and parking garages; therefore, the affected environment is limited to properties displaced by these parking facilities and adjacent properties. Appendix A contains maps of the BRT Alternative's alignment and permanent envelope, which includes the ROW for the park & ride lots and parking garages.

The 103rd Street stop would have a park & ride lot along Michigan Avenue between 102nd Street and 103rd Street. The park & ride would be mostly on vacant land, but would displace one single-family residence. The adjacent properties along Indiana Avenue contain single-family residential uses. The adjacent properties along Michigan Avenue contain urban mixed-use, multi-family residential, and vacant land.

The 111th Street stop would have a park & ride lot within the block bordered by Michigan Avenue, 111th Place, State Street, and 112th Street. The park & ride would be on vacant land behind the urban mixed uses on Michigan Avenue. There are limited urban mixed uses along 111th Place and 112th Street. The New Testament Baptist Church is the only adjacent institutional use.

The Kensington Avenue stop would have a multi-level parking garage along Michigan Avenue between Kensington Avenue and 116th Street. The parking garage would be located on land that is vacant except for one vacant industrial building. The adjacent properties along Kensington Avenue and 116th Street contain single-family residential uses. The UPRR track also borders the location of the parking garage.

The 130th Street stop would have a multi-level parking garage on the north side of 130th Street near Eberhart Avenue. The parking garage would be located on property of the Calumet Water Reclamation Plant, owned by the MWRD.

4.2 Union Pacific Railroad Rail Alternative - Right-of-Way Option

The alignment of the UPRR Rail Alternative ROW Option (ROW Option) would run from CTA's 95th Street Terminal along the I-94 and I-57 medians, transition to the centerline of the UPRR corridor, and run to the 130th Street station. The ROW Option corridor would be within the previous ROW of the UPRR, and would cross the Washington Heights, Roseland, West Pullman, and Riverdale neighborhoods. Land acquisitions would be required for construction of park & ride lots, parking garages, and electric substations. The following subsections briefly describe the affected environment in Segment UA (95th Street to 117th Street) and Segment UB (117th Street to 130th Street). Appendix B contains maps of the ROW Option permanent envelope, which would include the ROW for the structural alignment, stations, park & ride lots, parking garages, and electric substations.

4.2.1 Segment UA

95th Street to 99th Street
The north end of the ROW Option alignment would be at the 95th Street Terminal. The alignment would be within the median of I-94 and I-57, which are considered transportation uses. Then it would transition from the I-57 median to the UPRR corridor at approximately 99th Street.

99th Street to 103rd Street
The property adjacent to the west side of the ROW Option alignment is open space (Fernwood Parkway). The adjacent properties along the east side include open space (Wendell Smith Park) and single-family residential uses. The alignment would cross the northwest corner of Wendell Smith Park. Two park & ride lots would be located along 103rd Street on vacant land and on a vacant industrial property, which are adjacent to single-family residential uses and urban mixed uses.

103rd Street to 111th Street
The properties adjacent to the west side of the ROW Option alignment contain urban mixed uses, industrial uses, and vacant land. An electric substation would be located on vacant land at 105th Street on the west side, with adjacent single-family residences separated by an alley. The adjacent properties along the east side include open space (Block Park), utility (Roseland Pump House), single-family residential uses, industrial uses, and vacant land. Two park & ride lots would be located along 111th Street on vacant land, adjacent to institutional uses and single-family residential uses.

111th Street to 115th Street
The properties adjacent to the west side of the ROW Option alignment contain urban mixed uses, industrial uses, single-family residential uses, and vacant land. The adjacent properties along the east side contain single-family residential uses, urban mixed uses, and vacant land

115th Street to 117th Street
An electric substation would be located on vacant land at the end of Lafayette Avenue, adjacent to single-family residences. For the Michigan Avenue station, a multi-level parking garage would be located along 116th Street and State Street on single-family residential properties. A park & ride lot would be located along Michigan Avenue between Kensington Avenue and 116th Street on mostly

vacant land, except for one vacant industrial building. The adjacent properties contain single-family residences.

4.2.2 Segment UB

117th Street to 130th Street

The ROW Option's alignment would be located on industrial, transportation, and utility properties from 117th Street to the 130th Street station. For the 130th Street station (South Option), a multi-level parking garage and adjacent electric substation would be located on the MWRD Calumet Water Reclamation Plant property north of 130th Place. For the 130th Street station (West Option), a multi-level parking garage and a park & ride lot would be located on MWRD property along 130th Street across from the Altgeld Gardens public housing. An electric substation would be located on MWRD property north of 130th Place.

4.2.3 120th Street Yard and Shop

A new train maintenance yard and shop for CTA's Red Line would be located near 120th Street and Cottage Grove Avenue on vacant land and industrial property. An electric substation would be located in the same area. Adjacent properties contain vacant land, industrial, transportation, and utility uses.

4.3 Union Pacific Railroad Alternative - East Option

The alignment of the UPRR Alternative East Option (East Option) would run from CTA's 95th Street Terminal along the I-94 and I-57 medians, transition to the east side of the UPRR corridor, and run south to the 130th Street station. The alignment would cross the Washington Heights, Roseland, West Pullman, and Riverdale neighborhoods. Because the alignment would be east of the existing UPRR ROW within an urbanized area, considerable land would be required for ROW acquisitions, park & ride lots, parking garages, and electric substations. The following subsections briefly describe the affected environment in Segment UA (95th Street to 117th Street) and Segment UB (117th Street to 130th Street) of the East Option. Appendix C contains maps of the East Option permanent envelope, which would include the ROW for the structural alignment, stations, park & ride lots, parking garages, and electric substations.

4.3.1 Segment UA

95th Street to 99th Street

The alignment would start at the 95th Street Terminal and would run within the median of I-94 and I-57, which are considered transportation uses. The alignment would transition from the I-57 median to the East Option corridor at approximately 99th Street.

99th Street to 103rd Street

The alignment would affect an open space (Wendell Smith Park) and several single-family residential properties per street. Two park & ride lots would be located along 103rd Street on vacant land and a vacant industrial property; these vacant lands are adjacent to single-family residential uses and urban mixed uses.

103rd Street to 111th Street

The alignment would affect an open space (Block Park), alter course to run adjacent to a utility (Roseland Pump House) along UPRR property, and then affect property with single-family residential uses, industrial uses, and vacant land. An electric substation would be on vacant land at 105th Street on the western perimeter of the UPRR corridor, with adjacent single-family residences separated by an alley. A park & ride lot would be located along 111th Street on vacant land, adjacent to an institutional use and vacant land. Another park & ride would be located on 110th Place on vacant land, surrounded by single-family residential uses.

111th Street to 115th Street

The alignment would affect several single-family residential properties per street, as well as urban mixed-use parcels and vacant land.

115th Street to 117th Street

The alignment would affect properties with primarily single-family residential uses and vacant land. An electric substation would be located at the end of Lafayette Avenue on vacant land adjacent to single-family properties. The Michigan Avenue station would affect primarily vacant land. Adjacent to the station, a multi-level parking garage would be located along 116th Street and State Street on single-family residential properties. A park & ride lot would be located along Michigan Avenue between Kensington Avenue and 116th Street on land that is mostly vacant except for one vacant industrial building. The adjacent properties contain single-family residences.

4.3.2 Segment UB

117th Street to 130th Street

The East Option alignment varies slightly from the ROW Option alignment between 117th Street and the Canadian National (CN) railroad, and would affect the same area as the ROW Option from the CN railroad to 130th Street. See the description in Section 4.2.2.

4.3.3 120th Street Yard and Shop

The affected area would be the same as described in Section 4.2.3 for the ROW Option.

4.4 Union Pacific Railroad Alternative - West Option

The alignment of the UPRR Alternative West Option (West Option) would run from CTA's 95th Street Terminal along the I-94 and I-57 medians, transition to the west side of the UPRR corridor, and run to the 130th Street station. The alignment would cross the Washington Heights, Roseland, West Pullman, and Riverdale neighborhoods. Because this alignment would be west of the UPRR ROW within an urbanized area, considerable land acquisitions would be required for ROW, park & ride lots, parking garages, and electric substations. The following subsections briefly describe the affected environment in Segment UA (95th Street to 117th Street) and Segment UB (117th Street to 130th Street). Appendix D contains maps of the West Option permanent envelope, which would include the ROW for the structural alignment, stations, park & ride lots, parking garages, and electric substations.

4.4.1 Segment UA

95th Street to 99th Street

The alignment would start at the 95th Street Terminal and would be within the median of I-94 and I-57, which is considered a transportation use. The alignment would transition from the I-57 median to the West Option corridor at approximately 99th Street.

99th Street to 103rd Street

The alignment would be within a linear open space (Fernwood Parkway) that is directly across the street from single-family residences facing the open space. The 103rd Street station would be located on open space, a vacant industrial property, and vacant land, and a park & ride lot would be located on 103rd Place on vacant land adjacent to the station. These facilities would be adjacent to single-family residential properties.

103rd Street to 111th Street

The alignment would affect primarily urban mixed uses and vacant properties, as well as one active industrial property at 109th Street. The adjacent properties contain the back yard garages of single-family residences, which are separated by an alley. An electric substation would be located on vacant land at 105th Street on the eastern side of the UPRR corridor, with adjacent single-family residences. A park & ride lot would be located along 111th Street on vacant land, and adjacent land uses are institutional, single-family residences, and vacant land.

111th Street to 115th Street

The alignment would affect several properties with urban mixed uses, as well as vacant land and several single-family residential properties. The adjacent properties are primarily single-family uses.

115th Street to 117th Street

The alignment would affect properties with limited single-family residential and industrial uses and vacant land. An electric substation would be located at the end of Lafayette Avenue on vacant land and single-family residential properties with adjacent single-family uses. The Michigan Avenue station would be located on single-family residential properties and vacant land. Adjacent to the station, a multi-level parking garage would be located along 116th Street and State Street on single-family residential properties.

4.4.2 Segment UB

117th Street to 130th Street

The alignment would cross over the UPRR ROW from west to east between Indiana and Calumet Avenues. The adjacent properties contain single-family residences. The West Option alignment varies slightly from the ROW Option alignment between 117th Street and the CN railroad, and would affect the same area as the ROW Option from the CN railroad to 130th Street. See the description in Section 4.2.2.

4.4.3 120th Street Yard and Shop

The affected area would be the same as that described in Section 4.2.3.

4.5 Halsted Rail Alternative

The north end of the alignment of the Halsted Rail Alternative would be at CTA's 95th Street Terminal. The alignment would run within interstate ROW and the median of Halsted Street, a north-south arterial about 1 mile west of I-94 Dan Ryan Expressway, and the 95th Street Terminal. The alignment would cross the Washington Heights, Roseland, Morgan Park, and West Pullman neighborhoods in Chicago, and the Village of Calumet Park. The alignment would be within public ROW of interstate highways and a commercial arterial with urban mixed uses and institutional uses. Land acquisitions would be required for park & ride lots, parking garages, and electric substations; therefore, the affected environment would be limited to these facilities and adjacent properties. The following subsections briefly describe the affected environment in Segment HA (95th Street Terminal to 120th and Halsted Streets) and Segment HB (120th to 129th Street on Halsted Street) of the Halsted Rail Alternative. Appendix F contains maps of the Halsted Rail Alternative permanent envelope, which would include the ROW for the structural alignment, stations, park & ride lots, parking garages, and electric substations.

4.5.1 Segment HA

95th Street to 99th Street

The north end of the alignment would be at the 95th Street Terminal. The alignment would be within the median of I-94 and I-57, which are considered transportation uses. The alignment would transition from the I-57 median to the Halsted corridor at approximately 99th Street.

99th Street to 103rd Street

As part of the transition from I-57 to Halsted Street, the alignment would affect several urban mixed-use properties and a single-family residence. An electric substation would be located at 101st Street on vacant properties, adjacent to a church and single-family residences. A park & ride lot would be located on several urban mixed-use properties at 103rd and Halsted Streets, a location that is adjacent to urban mixed uses and single-family residences.

103rd Street to 111th Street

An electric substation would be located at 110th and Halsted Streets on vacant land, adjacent to urban mixed uses and single-family residences. A park & ride lot would be located on urban mixed-use properties at 111th and Halsted Streets, a location that is adjacent to urban mixed uses and single-family residences.

111th Street to 120th Street

An electric substation would be located at 118th and Halsted Streets on vacant land, adjacent to vacant land and single-family residences. A large park & ride lot would be located at 119th and Halsted Streets on properties containing several urban mixed uses and limited industrial uses.

4.5.2 Segment HB

120th Street to 129th Street

An electric substation would be located at 126th and Halsted Streets on urban mixed-use property, adjacent to single-family residences. A multi-level parking garage would be located on urban mixed-use and single-family residential properties bordered by Vermont Avenue and

Halsted, Green, and 128th Streets. The adjacent properties are urban mixed uses and single-family residences. A park & ride lot would be located on the southeast corner of Vermont and Halsted Streets on urban mixed uses, adjacent to single-family residences.

4.5.3 119th Street Yard and Shop

A new train maintenance yard and shop for CTA's Red Line would be located at 119th and Peoria Streets, within the West Pullman Industrial Corridor. The majority of the land area contains vacant and cleared industrial properties, except for a limited amount of urban mixed uses.

Section 5
Impacts and Mitigations

The Uniform Act, as described in Sections 1 and 3, must be complied with if displacements occur as a direct cause of the project. Owners of private property possess federal constitutional guarantees that their property will not be taken or damaged for public use without just compensation, which is measured by fair market value as determined by appraisers for both the CTA and the property owner, and ultimately the court if the parties cannot agree. The Uniform Act also requires that relocation services and/or payments be made to residential and business owners and to residential and business tenants.

For purposes of evaluating the potential displacements and relocation impacts, the area of potential impact was limited to within and directly adjacent to the future ROW of each alternative evaluated as part of the EIS. Impacts on many of the parcels and buildings identified in this section might be avoidable or reducible through design. The data and assumptions upon which this analysis is based represent the level of detail permitted by the conceptual design of the RLE alternatives, and reflect an approximate number of displacements and relocations. Displacement findings will be refined and confirmed during final design.

The subsections below contain maps and tables with displacement data for each affected neighborhood. The total approximate number of displacements includes parcels and buildings on land that is needed for the permanent operation of each alternative. Because all construction activities would occur on land acquired for the permanent ROW, there would be no temporary displacement or relocation impacts associated solely with the construction phase. Easements would be needed for the proposed permanent envelope of any of the rail alternatives, and would be negotiated with IDOT, the City of Chicago, and other political subdivisions. The number of parcels that would be affected by easements is highlighted in the introduction for each rail alternative in this section.

5.1 No Build Alternative

The No Build Alternative is an alternative used for comparative purposes to assess the benefits and impacts of the build alternatives. There would be no displacements or relocations associated with any portion of the No Build Alternative.

5.2 Bus Rapid Transit Alternative

The BRT Alternative is meant to identify lower cost improvements and ROW requirements than the other build alternatives. The BRT Alternative would only affect properties needed for park & ride lots and parking garages near bus stop locations. The BRT Alternative would require fewer permanent acquisitions and displacements than the other build alternatives.

5.2.1 Permanent Impacts and Mitigations - Bus Rapid Transit Alternative

As shown in Table 5-1, the BRT Alternative would affect 52 parcels and displace 3 buildings. With just compensation and relocation assistance per the Uniform Act, the impacts would be considered not substantially adverse because of available vacant land in the project area. In addition, the availability of similar real estate within the project area would facilitate relocation. Figures 5-1 and 5-2 highlight the concentration of affected parcels in the project area, while more detailed maps of affected parcels and building displacements are within Appendix A.

Figure 5-2: Bus Rapid Transit Alternative - Displacements

The 103rd Street stop would have a park & ride lot on Michigan Avenue between 102nd Street and 103rd Street. This park & ride lot would affect 15 parcels and displace 1 single-family residence and 1 commercial cell tower. The 111th Street stop would have a park & ride lot within the block bordered by Michigan Avenue, 111th Place, State Street, and 112th Street. This park & ride lot would affect 16 parcels and 1 institutional parcel. Both park & ride lots would be within Roseland.

The Kensington Avenue stop would have a multi-level parking garage with ground-floor retail and community facilities at Kensington and Michigan Avenues. This parking garage would affect 18 parcels and displace 1 vacant industrial building within West Pullman.

The 130th Street stop would have a multi-level parking garage on the north side of 130th Street and Eberhart Avenue. This parking garage would affect two utility parcels within Riverdale.

Table 5-1: Bus Rapid Transit Alternative - Permanent Displacements*

Land Use Type	Affected Parcels	Building Displacements
Vacant	18	
Single-Family Residential	1	1
Commercial	2	1
Institutional (Place of Worship)	1	
Industrial	3	1
Utility (MWRD)	2	
Transportation (Railroad)	1	
Public (City of Chicago)**	24	
Totals	**52**	**3**

Notes: MWRD = Metropolitan Water Reclamation District
*Building displacements are a subset of affected parcels and relate to a primary building displacement and/or a secondary structure.
**The publicly owned parcels are considered “affected parcels” and not easements, because the CTA would need to negotiate a fee simple property transfer or an easement with the public entity.

5.2.2 Construction Impacts and Mitigations - Bus Rapid Transit Alternative

Because all construction activities would occur within the public ROW for bus stop facilities or on land acquired for the parking facilities, there would be no temporary displacement or relocation impacts associated solely with the construction phase.

5.2.3 Cumulative Impacts and Mitigations - Bus Rapid Transit Alternative

No other projects identified in the *Cumulative Impacts Technical Memorandum* would cause displacements within the area of potential impact.

5.3 Union Pacific Railroad Rail Alternative - Right-of-Way Option

For this analysis, it was assumed that the UPRR trains would relocate to another corridor as part of a separate, earlier project that may occur regardless of RLE implementation and that the current railroad ROW would be publicly owned after freight operations have moved to a new alignment. The ROW Option would affect properties needed for park & ride lots, parking garages, electric substations, and maintenance yard. The ROW Option would have more land acquisitions and building displacements than the BRT Alternative, but less than the other UPRR build alternatives. The ROW Option and Halsted Rail Alternative would have a comparable number of affected properties.

5.3.1 Permanent Impacts and Mitigations - Union Pacific Railroad Rail Alternative - Right-of-Way Option

As shown in Table 5-2, the ROW Option would require 133 parcel acquisitions and 24 building displacements. With just compensation and relocation assistance per the Uniform Act, the impacts would be considered not substantially adverse because of the general availability of vacant land in the project area and the beneficial impacts of the project, including new rail transit with four stations, greater accessibility to the region, improved access to jobs, and new development opportunities in the project area. In addition, the availability of similar real estate within the project area would facilitate relocation. A total of 22 parcel easement agreements via negotiations with IDOT would be required for the aerial structure of the RLE Project. Figures 5-3 and 5-4 highlight the affected parcels on a project area map, while detailed parcel maps are within Appendix B. The following subsections describe the impacts in Segment UA (95th Street to 117th Street) and Segment UB (117th Street to 130th Street), and from the 120th Street yard and shop.

Table 5-2: Union Pacific Railroad Rail Alternative - Right-of-Way Option - Permanent Displacements*

Land Use Type	Affected Parcels	Building Displacements
Vacant	13

Figure 5-4: Union Pacific Railroad Rail Alternative - Right-of-Way Option - Displacements

5.3.1.1 Segment UA

95th Street to 99th Street

The alignment would be within the median of I-94 and I-57, which are interstate highways under the jurisdiction of IDOT and the Federal Highway Administration (FHWA). A total of 22 parcel easement agreements would be required for the aerial structure of the RLE Project.

99th Street to 103rd Street Station

As the part of transition from the I-57 median to the ROW Option corridor, the alignment would cross the western portion of Wendell Smith Park (see *Parklands and Community Facilities Technical Memorandum*). The alignment would be along the centerline of the UPRR corridor, which would be publicly owned. Two park & ride lots would be on 103rd Street adjacent to the station. As a result, the permanent envelope would affect 12 parcels and displace 1 single-family residence and 1 vacant commercial building within the Roseland neighborhood.

Table 5-3: Union Pacific Railroad Rail Alternative - Right-of-Way Option - Permanent Displacements (99th Street to 103rd Street Station)*

Land Use Type	Affected Parcels	Building Displacements
Vacant	2	
Single-Family Residential	1	1
Commercial	1	1
Public (City of Chicago)**	8	
Totals	**12**	**2**

*Building displacements are a subset of affected parcels and relate to a primary building displacement and/or a secondary structure.
**The publicly owned parcels are considered “affected parcels” and not easements, because the CTA would need to negotiate a fee simple property transfer or an easement with the public entity.

103rd Street to 111th Street Station

The alignment would be along the centerline of the UPRR corridor, which would be publicly owned. An electric substation at 105th Street would affect one vacant land parcel on the western perimeter of the UPRR corridor. Two park & ride lots would be on 111th Street adjacent to the station: one on vacant land east of the alignment, and one on vacant land west of the alignment. As a result, the permanent envelope would affect 21 parcels within the Roseland neighborhood.

Table 5-4: Union Pacific Railroad Rail Alternative - Right-of-Way Option - Permanent Displacements (103rd Street to 111th Street Station)

Land Use Type	Affected Parcels	Building Displacements
Vacant	1	
Institutional (Place of Worship)	1	
Industrial	2	
Public (City of Chicago)*	17	
Totals	**21**	

*The publicly owned parcels are considered “affected parcels” and not easements, because the CTA would need to negotiate a fee simple property transfer or an easement with the public entity.

111th Street to 115th Street

The alignment would be along the centerline of the UPRR corridor, which would be publicly owned. As a result, the permanent envelope would affect seven city-owned parcels.

115th Street to 117th Street

The alignment would be along the centerline of the UPRR corridor, which would be publicly owned. An electric substation would be located on vacant land at the end of Lafayette Avenue. Adjacent to the Michigan Avenue station, a multi-level parking garage along 116th Street and State Street would require displacement of 14 single-family residences, as well as 2 businesses. A park & ride lot would be located along Michigan Avenue between Kensington Avenue and 116th Street on mostly vacant land. As a result, the permanent envelope would affect 56 parcels and displace 14 single-family residences, 1 multi-family residence, 1 commercial building, 1 mixed-use building, and 1 vacant industrial building within West Pullman.

Table 5-5: Union Pacific Railroad Rail Alternative - Right-of-Way Option - Permanent Displacements* (115th to 117th Street)*

Land Use Type	Affected Parcels	Building Displacements
Vacant	8	
Single-Family Residential	17	14
Multi-Family Residential	1	1
Commercial	2	1
Mixed-Use (Retail/Office/Residential)	1	1
Industrial	3	1
Public (City of Chicago)**	24	
Totals	**56**	**18**

*Building displacements are a subset of affected parcels and relate to a primary building displacement and/or a secondary structure.
**The publicly owned parcels are considered “affected parcels” and not easements, because the CTA would need to negotiate a fee simple property transfer or an easement with the public entity.

5.3.1.2 Segment UB

117th Street to Front Avenue

Between 117th Street and Calumet Avenue, the alignment would be along the centerline of the UPRR corridor, which would be publicly owned. From Calumet Avenue to Front Avenue, the alignment would transition to the east and would affect one industrial property. As a result, the permanent envelope would affect six parcels and displace one industrial building within West Pullman.

Table 5-6: Union Pacific Railroad Rail Alternative - Right-of-Way Option - Permanent Displacements (117th Street to Front Avenue)*

Land Use Type	Affected Parcels	Building Displacements
Industrial	3	1
Public (City of Chicago)**	3	
Totals	**6**	**1**

*Building displacements are a subset of affected parcels and relate to a primary building displacement and/or a secondary structure.
**The publicly owned parcels are considered “affected parcels” and not easements, because the CTA would need to negotiate a fee simple property transfer or an easement with the public entity.

Front Avenue to 130th Street Station

South of Front Avenue, the alignment would cross the existing CN/Metra railroad tracks and other railroad properties. The alignment would then transition from an aerial structure to an at-grade alignment and would remain at grade to the 130th Street station (South Option). The alignment ROW would run through several industrial properties and utility properties. A multi-level parking garage, adjacent electric substation, and bus and auto access roads would be located on vacant utility properties owned by MWRD. South of Front Avenue, the permanent envelope would affect 16 parcels within the Riverdale neighborhood. (Note: The permanent envelopes for the 130th Street West Station Option and South Station Option would affect the same parcels.).

Table 5-7: Union Pacific Railroad Rail Alternative - Right-of-Way Option - Permanent Displacements (Front Avenue to 130th Street)

Land Use Type	Affected Parcels	Building Displacements
Industrial	2	
Utility (MWRD)	7	
Transportation (CN/Metra)	3	
Transportation (IHB)	4	
Totals	**16**	

Notes: MWRD = Metropolitan Water Reclamation District, CN = Canadian National, IHB = Indiana Harbor Belt

5.3.2 Construction Impacts and Mitigations - Union Pacific Railroad Rail Alternative - Right-of-Way Option

Because all construction activities would occur on land acquired for the permanent ROW, there would be no temporary displacement or relocation impacts associated solely with the construction phase.

5.3.3 Cumulative Impacts and Mitigations - Union Pacific Railroad Rail Alternative - Right-of-Way Option

No other projects identified in the *Cumulative Impacts Technical Memorandum* would cause displacements within the area of potential impact. If any future displacements would occur as part of a separate project prior to CTA's construction of the RLE Project, CTA would coordinate efforts to minimize cumulative displacement impacts.

5.3.4 120th Street Yard and Shop

5.3.4.1 Permanent Impacts and Mitigations

A new train maintenance yard and shop for CTA's Red Line would be located in the vicinity of 120th Street and Cottage Grove Avenue. An electric substation would be located adjacent to the maintenance yard. These facilities would affect primarily railroad properties and utility properties. As a result, the permanent envelope would affect 15 parcels within the Riverdale neighborhood. There would be three building displacements associated with these facilities. Table 5-8 lists the lists the number of affected parcels and displacements by land use type and the number of buildings displaced.

Table 5-8: 120th Street Yard and Shop - Permanent Displacements*

Land Use Type	Affected Parcels	Building Displacements
Vacant	2	
Industrial	1	2
Utility (MWRD)	8	
Transportation (IHB)	2	1
Transportation (NICTD/CSS & SBRR)	2	
Totals	**15**	**3**

Notes: MWRD = Metropolitan Water Reclamation District, IHB = Indiana Harbor Belt, NICTD/CSS & SBRR = Northern Indiana Commuter Transportation District Chicago South Shore & South Bend Railroad
*Building displacements are a subset of affected parcels and relate to a primary building displacement and/or a secondary structure.

5.3.4.2 Construction Impacts and Mitigations

Because all construction activities would occur on land acquired for the permanent ROW, there would be no temporary displacement or relocation impacts associated solely with the construction phase.

5.4 Union Pacific Railroad Rail Alternative - East Option

The corridor alignment of the UPRR Rail Alternative - East Option (East Option) would be primarily east of the existing ROW of the UPRR. The East Option would affect numerous residential, mixed-use, and industrial properties needed for the alignment ROW, park & ride lots, parking garages, electric substations, and maintenance yard. The East Option would have many more land acquisitions and building displacements than the ROW Option, Halsted Rail Alternative, or BRT Alternative. The East Option and West Option would affect a comparable number of properties.

5.4.1 Permanent Impacts and Mitigations - Union Pacific Railroad Rail Alternative - East Option

As shown in Table 5-9, the East Option would affect 256 parcels and displace 112 buildings. With just compensation and relocation assistance per the Uniform Act, the impact would be considered not substantially adverse because of the general availability of vacant land in the project area and the beneficial impacts of the project including new rail transit with four stations, greater accessibility to the region, improved access to jobs, and new development opportunities in the project area. In addition, the availability of similar real estate within the project area would facilitate relocation. A total of 22 parcel easement agreements via negotiations with IDOT would be required for the aerial structure of the RLE Project, as well as 4 parcel easement agreements through negotiations with the City of Chicago. Figures 5-5 and 5-6 highlight the affected parcels on a project area map, while detailed parcel maps are within Appendix C. The following subsections describe the impacts in Segment UA (95th Street to 117th Street) and Segment UB (117th Street to 130th Street), and from the 120th Street yard and shop.

Table 5-9: Union Pacific Railroad Rail Alternative - East Option - Permanent Displacements*

Land Use Type	Affected Parcels	Building Displacements
Vacant	56

Figure 5-6: Union Pacific Railroad Rail Alternative - East Option - Displacements

5.4.1.1 Segment UA

95th Street to 99th Street

The alignment would be within the medians of I-94 and I-57, which are interstate highways under the jurisdiction of IDOT and the FHWA. A total of 22 parcel easement agreements would be required for the aerial structure of the RLE Project.

99th Street to 103rd Street Station

As the part of the transition from the I-57 median to the East Option corridor, the alignment would cross the western portion of Wendell Smith Park (see *Parklands and Community Facilities Technical Memorandum*). The alignment would run through numerous single-family residential properties per street from 99th Place through 103rd Street, as well as some vacant land. The 103rd Street station would affect this area between 102nd and 103rd Streets. A park & ride lot would be located adjacent to the station on vacant land. Another park & ride lot would be located at 103rd Street on the western perimeter of the UPRR ROW. As a result, the permanent envelope would affect 37 parcels and displace 25 single-family residences and 1 vacant commercial building within the Roseland neighborhood. Table 5-10 lists the number of affected parcels and displacements by land use type and the number of buildings displaced.

Table 5-10: Union Pacific Railroad Rail Alternative - East Option - Permanent Displacements (99th Street to 103rd Street Station)*

Land Use Type	Affected Parcels	Building Displacements
Vacant	4	
Single-Family Residential	28	25
Commercial	1	1
Industrial	1	
Transportation (Union Pacific Railroad)	1	
Public (City of Chicago)**	2	
Totals	**37**	**26**

*Building displacements are a subset of affected parcels and relate to a primary building displacement and/or a secondary structure.

**The publicly owned parcels are considered “affected parcels” and not easements, because the CTA would need to negotiate a fee simple property transfer or an easement with the public entity.

103rd Street to 111th Street Station

The 103rd Street station and alignment would cross Block Park (see *Parklands and Community Facilities Technical Memorandum*). Running south through Block Park, the alignment would alter course and run adjacent to a utility (Roseland Pump House) along UPRR property and then alter course outside the UPRR property. This segment of the alignment would affect five parcels owned by the UPRR. Location of an electric substation at 105th Street would affect one vacant parcel and displace one vacant single-family residence on the western perimeter of the UPRR.

South of 105th Street, the alignment would curve back outside of the UPRR property and would affect vacant land, several single-family residential uses, a few industrial uses, and the open space of an institutional use (Roseland Christian School). The 111th Street station also would affect this area between 110th and 111th Streets. Two park & ride lots would be located adjacent to the 111th Street station: one on vacant land east of the station on 110th Place, and one on vacant land west of the UPRR on 111th Street.

Between 103rd Street and 111th Street, the permanent envelope would affect 57 parcels and displace 14 single-family residences, 1 multi-family residence, and 3 industrial buildings within the Roseland neighborhood. The number of affected parcels and displacements by land use type and the number of buildings displaced is listed in Table 5-11.

Table 5-11: Union Pacific Railroad Rail Alternative - East Option - Permanent Displacements (103rd Street to 111th Street Station)*

Land Use Type	Affected Parcels	Building Displacements
Vacant	20	
Single-Family Residential	14	14
Multi-Family Residential	1	1
Institutional (School)	2	
Industrial	6	3
Transportation (Union Pacific Railroad)**	8	
Public (City of Chicago)***	6	
Totals	**57**	**18**

*Building displacements are a subset of affected parcels and relate to a primary building displacement and/or a secondary structure.
** Union Pacific Railroad right-of-way maps containing hand-written notes indicate a sale of some land area to the City of Chicago in the vicinity of Roseland Pump House; however, Cook County Assessor data indicates that all parcels are owned by the railroad.
***The publicly owned parcels are considered "affected parcels" and not easements, because the CTA would need to negotiate a fee simple property transfer or an easement with the public entity.

111th Street to 115th Street

The alignment would run through several single-family residential properties per street, as well as a few industrial properties, vacant land, and a place of worship. As a result, the permanent envelope would affect 57 parcels and displace 21 single-family residences, 6 multi-family residences, 4 industrial buildings, and 1 place of worship (Table 5-12).

Table 5-12: Union Pacific Railroad Rail Alternative - East Option - Permanent Displacements (111th to 115th Street)*

Land Use Type	Affected Parcels	Building Displacements
Vacant	16	
Single-Family Residential	24	21
Multi-Family Residential	7	6
Institutional (Place of Worship)	1	1
Industrial	4	4
Transportation (Union Pacific Railroad)	4	
Public (City of Chicago)**	1	
Totals	**57**	**32**

*Building displacements are a subset of affected parcels and relate to a primary building displacement and/or a secondary structure.
**The publicly owned parcels are considered "affected parcels" and not easements, because the CTA would need to negotiate a fee simple property transfer or an easement with the public entity.

115th Street to 117th Street

The alignment would cross several single-family residential properties, commercial properties, and vacant land. An electric substation would be located on vacant land at the end of Lafayette Avenue, west of the UPRR track. The Michigan Avenue station would affect primarily vacant land. Adjacent to the station, a three-story parking garage would be located along 116th Street and State

Street on single-family residential properties. A park & ride lot would be located along Michigan Avenue between Kensington Avenue and 116th Street on mostly vacant land, except for one vacant industrial building. In addition, four parcels would be affected by an easement agreement that the City of Chicago negotiated with the developer of the proposed Roseland Plaza adjacent to the Michigan Avenue station and east of the UPRR track. As a result, the permanent envelope would affect 64 parcels and displace 21 single-family residences, 6 multi-family residences, 2 commercial buildings, 1 vacant industrial building, and 1 public building within West Pullman. Table 5-13 lists the number of affected parcels and displacements by land use type and the number of buildings that would be displaced by the UPRR East Option from 115th Street to 117th Street.

Table 5-13: Union Pacific Railroad Rail Alternative - East Option - Permanent Displacements (115th to 117th Street)*

Land Use Type	Affected Parcels	Building Displacements
Vacant	11	
Single-Family Residential	24	21
Multi-Family Residential	7	6
Commercial	3	2
Industrial	3	1
Transportation (Union Pacific Railroad)	5	
Public (City of Chicago)**	11	1
Totals	**64**	**31**

*Building displacements are a subset of affected parcels and relate to a primary building displacement and/or a secondary structure.
**The publicly owned parcels are considered “affected parcels” and not easements, because the CTA would need to negotiate a fee simple property transfer or an easement with the public entity.

5.4.1.2 Segment UB

117th Street to Front Avenue

Between 117th Street and Front Avenue, the alignment would run through vacant properties, a single-family residential property, and an industrial property. As a result, the permanent envelope would affect 12 parcels and displace 1 single-family residence and 1 industrial building within West Pullman between 117th Street and Front Avenue (Table 5-14).

Table 5-14: Union Pacific Railroad Rail Alternative - East Option - Permanent Displacements (117th Street to Front Avenue)*

Land Use Type	Affected Parcels	Building Displacements
Vacant	3	
Single-Family Residential	1	1
Commercial	2	
Industrial	4	1
Public (City of Chicago)**	2	
Totals	**12**	**2**

*Building displacements are a subset of affected parcels and relate to a primary building displacement and/or a secondary structure.
**The publicly owned parcels are considered “affected parcels” and not easements, because the CTA would need to negotiate a fee simple property transfer or an easement with the public entity.

Front Avenue to 130th Street Station

South of Front Avenue, the alignment would cross the existing CN/Metra railroad tracks and other railroad properties. The alignment would then transition from an aerial structure to at-grade to the 130th Street station (South Station Option). The alignment would run through several industrial properties and utility properties. A multi-level parking garage, adjacent electric substation, and bus and auto access roads would be on vacant utility properties owned by MWRD. South of Front Avenue, the permanent envelope would affect 15 parcels within the Riverdale neighborhood. The permanent envelopes for the 130th Street West Station Option and South Station Option would affect the same parcels. Table 5-15 lists the number of affected parcels and displacements by land use type and the number of buildings displaced.

Table 5-15: Union Pacific Railroad Rail Alternative - East Option - Permanent Displacements (Front Avenue to 130th Street)

Land Use Type	Affected Parcels	Building Displacements
Industrial	1	
Utility (MWRD)	7	
Transportation (CN/Metra)	3	
Transportation (IHB)	4	
Totals	**15**	

Notes: MWRD = Metropolitan Water Reclamation District, CN = Canadian National, IHB = Indiana Harbor Belt

5.4.2 Construction Impacts and Mitigations - Union Pacific Railroad Rail Alternative - East Option

Because all construction activities would occur on land acquired for the permanent ROW, there would be no temporary displacement or relocation impacts associated solely with the construction phase.

5.4.3 Cumulative Impacts and Mitigations - Union Pacific Railroad Rail Alternative - East Option

No other projects identified in the *Cumulative Impacts Technical Memorandum* would cause displacements within the area of potential impact. If any future displacements would occur as part of a separate project prior to CTA's construction of the Red Line Extension, CTA would coordinate efforts to minimize cumulative displacement impacts.

5.4.4 120th Street Yard and Shop

The impacts for the 120th Street yard and shop would be the same as for the ROW Option. See Section 5.3.4.

5.5 Union Pacific Railroad Rail Alternative - West Option

The corridor alignment of the UPRR Rail Alternative West Option (West Option) would be primarily west of the existing ROW of the UPRR. The West Option would affect numerous residential, mixed-use, and industrial properties needed for the alignment ROW, park & ride lots, parking garages, electric substations, and maintenance yard. The West Option would have many more land acquisitions and building displacements than the ROW Option, Halsted Rail

Alternative, or BRT Alternative. The West Option and East Option would affect a comparable number of properties.

5.5.1 Permanent Impacts and Mitigations - Union Pacific Railroad Rail Alternative - West Option

As shown in Table 5-16, the West Option would require 193 parcel acquisitions and 53 building displacements. With just compensation and relocation assistance per the Uniform Act, the impact would be considered not substantially adverse because of the general availability of vacant land in the project area and the beneficial impacts of the project including new rail transit with four stations, greater accessibility to the region, improved access to jobs, and new development opportunities in the project area. In addition, the availability of similar real estate within the project area would facilitate relocation. A total of 22 parcel easement agreements through negotiations with IDOT would be required for the aerial structure of the RLE Project, as well as 2 parcel easement agreements via negotiations with the City of Chicago. Figures 5-7 and 5-8 highlight the affected parcels on a project area map, while detailed parcel maps are within Appendix D. The following subsections describe the impacts in Segment UA (95th Street to 117th Street) and Segment UB (117th Street to 130th Street), and from the 120th Street yard and shop.

Table 5-16: Union Pacific Railroad Rail Alternative - West Option - Permanent Displacements*

Land Use Type	Affected Parcels	Building Displacements
Vacant	35	
Single-Family Residential	37	24
Multi-Family Residential	4	4
Commercial	18	8
Mixed-Use (Retail/Office/Residential)	2	2
Institutional (Place of Worship)	7	1
Industrial	20	13
Utility (MWRD)	15	
Transportation (Union Pacific Railroad)	29	
Transportation (CN/Metra)	3	
Transportation (IHB)	6	1
Transportation (NICTD/CSS & SBRR)	2	
Public (City of Chicago)**	15	
Totals	**193**	**53**

Notes: MWRD = Metropolitan Water Reclamation District, CN = Canadian National, IHB = Indiana Harbor Belt, NICTD/CSS & SBRR = Northern Indiana Commuter Transportation District Chicago South Shore & South Bend Railroad

*Building displacements are a subset of affected parcels and relate to a primary building displacement and/or a secondary structure.

**The publicly owned parcels are considered "affected parcels" and not easements, because the CTA would need to negotiate a fee simple property transfer or an easement with the public entity.

Figure 5-8: Union Pacific Railroad Rail Alternative - West Option - Displacements

5.5.1.1 Segment UA

95th Street to 99th Street

The alignment would be within the median of I-94 and I-57, which are interstate highways under the jurisdiction of IDOT and the FHWA. A total of 22 parcel easement agreements would be required for the aerial structure of the RLE Project.

99th Street to 103rd Street Station

As the part of the transition from the I-57 median to the West Option corridor, the alignment would cross the western portion of Wendell Smith Park (see *Parklands and Community Facilities Technical Memorandum*). West of the UPRR, the alignment would cross a linear open space (Fernwood Parkway) from 99th Place to 103rd Street. The 103rd Street station would be partially within this open space, straddling 103rd Street (see *Parklands and Community Facilities Technical Memorandum*).

The 103rd Street station and alignment would cross both sides of 103rd Street, which is the boundary between the Washington Heights neighborhood to the north and the Roseland neighborhood to the south. South of 103rd Street, the station, alignment ROW, and park & ride lot would affect four parcels and displace one vacant commercial building and one single-family residence within the Roseland neighborhood (Table 5-17).

Table 5-17: Union Pacific Railroad Rail Alternative - West Option - Permanent Displacements (99th Street to 103rd Street Station)*

Land Use Type	Affected Parcels	Building Displacements
Vacant	3	
Single-Family Residential	1	1
Commercial	1	1
Transportation (Union Pacific Railroad)	2	
Totals	**7**	**2**

*Building displacement impacts relate to a primary building displacement and/or a secondary structure.

103rd Street to 111th Street Station

South of the 103rd Street station to the 111th Street station, the alignment would run through a number of commercial and industrial properties, vacant properties, and city-owned properties. An electric substation would be located on vacant land at 105th Street on the eastern perimeter of the UPRR. A park & ride lot would be located on vacant land adjacent to the 111th Street station. As a result, the permanent envelope would affect 35 parcels and displace 8 industrial buildings and 1 commercial building within the Roseland neighborhood (Table 5-18).

Table 5-18: Union Pacific Railroad Rail Alternative - West Option - Permanent Displacements (103rd Street to 111th Street Station)*

Land Use Type	Affected Parcels	Building Displacements
Vacant	8	
Commercial	5	1
Institutional (Place of Worship)	1	
Industrial	12	8
Transportation (Union Pacific Railroad)	1	
Public (City of Chicago)**	8	
Totals	**35**	**9**

*Building displacements are a subset of affected parcels and relate to a primary building displacement and/or a secondary structure.

**The publicly owned parcels are considered “affected parcels” and not easements, because the CTA would need to negotiate a fee simple property transfer or an easement with the public entity.

111th Street to 115th Street

South of 111th Street, the alignment would curve in parallel with the UPRR property. The alignment would run through several commercial properties, several single-family residential properties, institutional property, vacant land, and property owned by the UPRR. As a result, the permanent envelope would affect 44 parcels and displace 10 buildings within the Roseland neighborhood. The number of affected parcels and displacements by land use type and the number of buildings displaced is listed in Table 5-19.

Table 5-19: Union Pacific Railroad Rail Alternative - West Option - Permanent Displacements (111th to 115th Street)*

Land Use Type	Affected Parcels	Building Displacements
Vacant	8	
Single-Family Residential	11	2
Multi-Family Residential	1	1
Commercial	8	4
Mixed-Use (Retail/Office/Residential)	1	1
Institutional (Place of Worship)	4	
Industrial	2	2
Transportation (Union Pacific Railroad)	9	
Totals	**44**	**10**

*Building displacements are a subset of affected parcels and relate to a primary building displacement and/or a secondary structure.

115th Street to 117th Street

The permanent envelope would run through numerous single-family residential properties, as well as vacant land, railroad property, city-owned property, and some mixed uses. An electric substation would be located at the end of Lafayette Avenue. The Michigan Avenue station would be located on single-family residential properties and vacant land. Adjacent to the station, a multi-level parking garage would be located along 116th Street and State Street on primarily single-family residential properties. As a result, the permanent envelope would affect 59 properties and displace 26 buildings within West Pullman, including 19 single-family residences (Table 5-20).

Table 5-20: Union Pacific Railroad Rail Alternative - West Option - Permanent Displacements (115th to 117th Street)*

Land Use Type	Affected Parcels	Building Displacements
Vacant	10	
Single-Family Residential	23	19
Multi-Family Residential	3	3
Commercial	3	2
Mixed-Use (Retail/Office/Residential)	1	1
Institutional (Place of Worship)	2	1
Transportation (Union Pacific Railroad)	13	
Public (City of Chicago)**	4	
Totals	**59**	**26**

*Building displacements are a subset of affected parcels and relate to a primary building displacement and/or a secondary structure.
**The publicly owned parcels are considered "affected parcels" and not easements, because the CTA would need to negotiate a fee simple property transfer or an easement with the public entity.

5.5.1.2 Segment UB

117th Street to Front Avenue

Between 117th Street and Front Avenue, the alignment would run through a variety of properties including single-family residential, industrial property, railroad property, and vacant land. As a result, the permanent envelope would affect 18 parcels and displace 3 buildings in the West Pullman neighborhood between 117th Street and Front Avenue. Table 5-21 lists the number of affected parcels and displacements by land use type and the number of buildings displaced.

Table 5-21: Union Pacific Railroad Rail Alternative - West Option - Permanent Displacements (117th Street to Front Avenue)*

Land Use Type	Affected Parcels	Building Displacements
Vacant	4	
Single-Family Residential	2	2
Commercial	1	
Industrial	4	1
Transportation (Union Pacific Railroad)	5	
Public (City of Chicago)**	2	
Totals	**18**	**3**

*Building displacements are a subset of affected parcels and relate to a primary building displacement and/or a secondary structure.
**The publicly owned parcels are considered "affected parcels" and not easements, because the CTA would need to negotiate a fee simple property transfer or an easement with the public entity.

Front Avenue to 130th Street Station

South of Front Avenue, the alignment would cross the existing CN/Metra railroad tracks and other railroad properties. The alignment would then transition from an aerial structure to an at-grade alignment and would remain at grade to the 130th Street station. The alignment would run through several industrial properties and utility properties. A multi-level parking garage, adjacent electric substation, and bus and auto access roads would be located on vacant utility properties owned by MWRD. South of Front Avenue, the permanent envelope would affect 15 parcels within the Riverdale neighborhood. The permanent envelopes for the 130th Street West Station Option and South Station Option would affect the same parcels. Table 5-22 lists the number of affected parcels and displacements by land use type and the number of buildings displaced.

Table 5-22: Union Pacific Railroad Rail Alternative - West Option - Permanent Displacements (Front Avenue to 130th Street)

Land Use Type	Affected Parcels	Building Displacements
Industrial	1	
Utility (MWRD)	7	
Transportation (CN/Metra)	3	
Transportation (IHB)	4	
Totals	**15**	

Notes: MWRD = Metropolitan Water Reclamation District, CN = Canadian National, IHB = Indiana Harbor Belt

5.5.2 Construction Impacts and Mitigations - Union Pacific Railroad Rail Alternative - West Option

Because all construction activities would occur on land acquired for the permanent ROW, there would be no temporary displacement or relocation impacts associated solely with the construction phase.

5.5.3 Cumulative Impacts and Mitigations - Union Pacific Railroad Rail Alternative - West Option

No other projects identified in the *Cumulative Impacts Technical Memorandum* would cause displacements within the area of potential impact. If any future displacements would occur as part of a separate project prior to CTA's construction of the Red Line Extension, CTA would coordinate efforts to minimize cumulative displacement impacts.

5.5.4 120th Street Yard and Shop

The impacts for the 120th Street yard and shop would be the same as for the ROW Option. See Section 5.3.4.

5.6 Halsted Rail Alternative

The corridor alignment of the Halsted Rail Alternative would be primarily within the public ROW of interstate highways and an arterial roadway. The Halsted Rail Alternative would affect properties needed for the elevated structure, park & ride lots, parking garages, electric substations, and maintenance yard. The Halsted Rail Alternative would have more land acquisitions and building displacements than the BRT Alternative, but fewer than the UPRR Rail Alternative West or East Options. The Halsted Rail Alternative and UPRR Rail Alternative ROW Option would affect a comparable number of properties.

5.6.1 Permanent Impacts and Mitigations - Halsted Rail Alternative

As shown in Table 5-23, the Halsted Rail Alternative would require a total of 108 parcel acquisitions and 37 building displacements. With just compensation and relocation assistance per the Uniform Act, the impact would be considered not substantially adverse because of the general availability of vacant land in the project area and the beneficial impacts of the project including new rail transit with four stations, greater accessibility to the region, improved access to jobs, and new development opportunities in the project area. In addition, the availability of similar real estate within the same neighborhoods would facilitate relocation. A total of 32 parcel easement agreements would be required for the aerial structure of the RLE Project. These easements would be acquired through negotiations with IDOT. Figures 5-9 and 5-10 highlight the affected parcels on a project area map, while detailed parcel maps are within Appendix F. The following subsections describe the impacts in Segment HA (95th Street to 120th Street) and Segment HB (120th to 129th Street on Halsted Street), as well as the 119th Street yard and shop. Table 5-23 displays the number of affected parcels and displacements by land use type and the number of buildings displaced.

Table 5-23: Halsted Rail Alternative - Total Permanent Displacements*

Land Use Type	Affected Parcels	Building Displacements
Vacant	22	
Single-Family Residential	13	11
Commercial	37	15
Mixed-Use (Retail/Office/Residential)	6	6
Institutional (Place of Worship)	1	1
Industrial	4	3
Transportation (Railroad)	5	
Transportation (Metra)	2	
Public (City of Chicago)**	18	2
Totals	**108**	**38**

Notes: MWRD = Metropolitan Water Reclamation District
*Building displacements are a subset of affected parcels and relate to a primary building displacement and/or a secondary structure.
**The publicly owned parcels are considered “affected parcels” and not easements, because the CTA would need to negotiate a fee simple property transfer or an easement with the public entity.

Figure 5-10: Halsted Rail Alternative - Displacements

5.6.1.1 Segment HA

95th Street to 99th Street

The alignment would run within the median of I-94 and I-57, which are interstate highways under the jurisdiction of IDOT and the FHWA. A total of 32 parcel easement agreements would be required for the aerial structure of the RLE Project.

99th Street to 103rd Street

As part of the transition from I-57 to Halsted Street, the structural columns for the elevated rail line and emergency access path would affect a single-family residence and six commercial properties. An electric substation would be located at 101st Street on vacant land. For the 103rd Street station, a park & ride lot would be located on the northwest corner of 103rd and Halsted Streets and would affect one mixed-use building, one single-use commercial building, and one commercial building with two active and two vacant businesses. As a result, the permanent envelope would affect 25 parcels and displace 1 mixed-use building and 4 commercial buildings within the Washington Heights neighborhood (Table 5-24).

Table 5-24: Halsted Rail Alternative - Permanent Displacements (99th to 103rd Streets)*

Land Use Type	Affected Parcels	Building Displacements
Vacant	8	
Single-Family Residential	2	
Commercial	14	4
Mixed-Use (Retail/Office/Residential)	1	1
Totals	**25**	**5**

*Building displacements are a subset of affected parcels and relate to a primary building displacement and/or a secondary structure.

103rd Street to 111th Street Station

An electric substation located at 110th and Halsted Streets would affect vacant land and a vacant commercial building in the Roseland neighborhood. For the 111th Street station, a park & ride lot located on the northwest corner of 111th and Halsted Streets would affect two commercial buildings in the Morgan Park neighborhood. As a result, the permanent envelope would affect seven parcels and displace three commercial buildings (Table 5-25).

Table 5-25: Halsted Rail Alternative - Permanent Displacements (103rd to 111th Street)*

Land Use Type	Affected Parcels	Building Displacements
Vacant	4	
Commercial	3	3
Totals	**7**	**3**

*Building displacements are a subset of affected parcels and relate to a primary building displacement and/or a secondary structure.

111th Street to 120th Street

The permanent envelope would cross a public multi-use path, the Major Taylor Bike Trail, between 118th and 119th Streets (see *Parklands and Community Facilities Technical Memorandum*). An electric substation would be located at 118th and Halsted Streets and would affect vacant land only. For the 119th Street station, a large park & ride lot would be located on the southwest corner of 119th and Halsted Streets and would affect one block of developed land. As a result, the permanent envelope would affect 19 parcels and displace 4 commercial buildings, 3 mixed-use buildings, and 2 industrial buildings in the West Pullman neighborhood (Table 5-26).

Table 5-26: Halsted Rail Alternative - Permanent Displacements (111th to 120th Street)*

Land Use Type	Affected Parcels	Building Displacements
Vacant	5	
Commercial	6	4
Mixed-Use (Retail/Office/Residential)	3	3
Industrial	3	2
Public (City of Chicago)**	2	
Totals	**19**	**9**

*Building displacements are a subset of affected parcels and relate to a primary building displacement and/or a secondary structure.

**The publicly owned parcels are considered "affected parcels" and not easements, because the CTA would need to negotiate a fee simple property transfer or an easement with the public entity.

5.6.1.2 Segment HB

120th Street to 129th Street

The permanent envelope would cross Metra's Blue Island Branch between 120th and 122nd Streets and would affect two of its ROW parcels. An electric substation would be located at 126th and Halsted Streets and would affect a commercial parking lot. For the Vermont Street station, a multi-level parking garage would be located on the southwest corner of Vermont and Halsted Streets and would affect 11 single-family residences and 2 commercial properties with 4 active businesses. A park & ride lot would be located on the southeast corner of Vermont and Halsted Streets and would affect two commercial properties. As a result, the permanent envelope would affect 26 parcels and displace 11 single-family residences and 4 commercial buildings in the West Pullman neighborhood (Table 5-27).

Table 5-27: Halsted Rail Alternative - Permanent Displacements (120th to 129th Street)*

Land Use Type	Affected Parcels	Building Displacements
Vacant	1	
Single-Family Residential	11	11
Commercial	12	4
Transportation (Metra)	2	
Totals	**26**	**15**

*Building displacements are a subset of affected parcels and relate to a primary building displacement and/or a secondary structure.

5.6.2 Construction Impacts and Mitigations - Halsted Rail Alternative

Because all construction activities would occur within the public ROW (median, streets and sidewalks) and on land acquired for the parking facilities and substations, there would be no temporary displacement or relocation impacts associated solely with the construction phase.

5.6.3 Cumulative Impacts and Mitigations - Halsted Rail Alternative

No other projects identified in the *Cumulative Impacts Technical Memorandum* would cause displacements within the area of potential impact. If any future displacements would occur as part of a separate project prior to CTA's construction of the Red Line Extension, CTA would coordinate efforts to minimize cumulative displacement impacts.

5.6.4 119th Street Yard and Shop

5.6.4.1 Permanent Impacts and Mitigations

A new train maintenance yard and shop for CTA's Red Line would be located at 119th and Peoria Streets, within the West Pullman Industrial Corridor. A new electric substation would be located within the same site. These new facilities would affect vacant land, vacant buildings, and city-owned properties as well as limited mixed uses. As a result, the permanent envelope would affect 31 parcels and displace 2 mixed-use buildings, 1 industrial building, and 1 place of worship within the West Pullman neighborhood (Table 5-28).

Table 5-28: 119th Street Yard and Shop - Permanent Displacements*

Land Use Type	Affected Parcels	Building Displacements
Vacant	4	
Commercial	2	
Mixed-Use (Retail/Office/Residential)	2	2
Institutional (Place of Worship)	1	1
Industrial	1	1
Transportation (Railroad)	5	
Public (City of Chicago)**	16	2
Totals	**31**	**6**

*Building displacements are a subset of affected parcels and relate to a primary building displacement and/or a secondary structure.

**The publicly owned parcels are considered "affected parcels" and not easements, because the CTA would need to negotiate a fee simple property transfer or an easement with the public entity.

5.6.4.2 Construction Impacts and Mitigations

Because all construction activities would occur on land acquired for the permanent ROW, there would be no temporary displacement or relocation impacts associated solely with the construction phase.

Section 6
Impacts Remaining After Mitigation

6.1 No Build Alternative

The No Build Alternative is an alternative used for comparative purposes to assess the benefits and impacts of the build alternatives. There would be no displacements or relocations associated with any portion of the No Build Alternative.

6.2 Bus Rapid Transit Alternative

Due to the requirements of the Uniform Act, there would be no adverse impacts remaining after mitigation for the BRT Alternative.

6.3 Union Pacific Railroad Rail Alternative - Right-of-Way Option

Due to the requirements of the Uniform Act, there would be no adverse impacts remaining after mitigation for the UPRR Rail Alternative ROW Option.

6.4 Union Pacific Railroad Rail Alternative - East Option

Due to the requirements of the Uniform Act, there would be no adverse impacts remaining after mitigation for the UPRR Rail Alternative East Option.

6.5 Union Pacific Railroad Rail Alternative - West Option

Due to the requirements of the Uniform Act, there would be no adverse impacts remaining after mitigation for the UPRR Rail Alternative West Option.

6.6 Halsted Rail Alternative

Due to the requirements of the Uniform Act, there would be no adverse impacts remaining after mitigation for the Halsted Rail Alternative.

Appendix G
Displacements Spreadsheets

Data Definitions
CTA RLE Displacement Excel Database

COLUMN HEADING	**DEFINITION**
Division	Geographic limits based on organization of Technical Memorandum Section 5
Segment	Geographic Segment corresponding to the Definition of Alternatives
Map ID	Number corresponding to a parcel on appendix map figure for each alternative
Parcel ID	Cook County Assessor parcel identification number
Address	Cook County Assessor parcel street address
Land Use – Field Verified	Field verified land use designations based on Cook County and CMAP data
Field Notes	Field survey notes used for parcel analysis in Technical Memorandum Section 5
Displacement Type	Type of effect on parcel by proposed alternative
Building Displacement	Number of building displacements within parcel
Land Use – Cook County	Cook County Assessor Land Use based on IMP_CODE

BRT Alternative
Parcels Affected by Land Acquisitions and Easements

Appendix H
Availability of Project Area Real Estate

The *Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970*, as amended (Uniform Act), contains specific requirements that determine the manner in which a government entity can acquire private property for public use when federal funds are used for a project. The purpose of this Act is to provide a uniform policy for fair and equitable treatment of persons and businesses displaced as a result of federal and federally assisted programs.

The Uniform Act, as amended ensures that displaced persons are relocated to a property that is comparable in size, features, and location; is decent, safe, and sanitary; and is within the financial means of the displaced person(s). Relocation assistance would be available to all individuals, families, businesses, and nonprofit organizations displaced as a result of the project. This assistance applies to tenants as well as owners occupying the real property needed for the project. Replacement properties must be located in the same type of neighborhood and be equally accessible to public services and places of employment. Chicago Transit Authority (CTA) would also provide assistance to displaced businesses and non-profit organizations to aid in their satisfactory relocation with a minimum of delay and loss in earnings. The RLE Project would proceed to construction only when all displaced families and businesses have been compensated for loss and provided the opportunity to be relocated to adequate replacement sites.

Consistent with US DOT policy as mandated by the Uniform Act, as amended, the CTA would provide relocation resources to all displaced persons without discrimination. All property owners from whom property is needed are entitled to receive just compensation for their land and property. Just compensation is based upon the fair market value of the property. CTA would provide, through its Relocation Assistance Program, payment and services to aid in movement to a new location.

Two Multiple Listing Service (MLS) databases were used to identify by zip code existing housing and commercial stock that is currently available for sale/lease in the RLE Project Area. The RLE Project area is primarily located in zip codes 60628 and 60643. An analysis of inventory of vacant land was also compiled from the findings of the Land Use Technical Memorandum to identify potential sites where additional housing units and/or commercial structures could be constructed within the existing communities.

The RLE Project could displace property ranging in land use and function. A variety of replacement property would be necessary to comply with the Uniform Act and to mitigate the effects of displacements on communities. Table 1-1 shows the number of displacements that would occur as a result of the build alternatives by land use type and zip code.

Table 1-1: Displacements by Alternative and Land Use Type

Displacements By Alternative						
Land Use Type	Zip Code	BRT	UPRR Rail ROW Option	UPRR Rail East Option	UPRR Rail West Option	Halsted Rail

	60643	--	--	--	--	2
	TOTAL	**0**	**0**	**1**	**0**	**2**

Based on a residential MLS search on November 29, 2012, there are a total of 235 single-family residential properties for sale in zip code 60628 and 199 in 60643. Available multi-family units within the project area total 80 properties, with 67 in zip code 60628 and 13 in zip code 60643. Table 1-2 summarizes available residential properties in the RLE Project Area.

Table 1-2: Available Residential Properties in RLE Project Area

Size	Cost Range	60628	60643	Total
Single-family residential properties for sale				
6 bed / 2 bath	$14,000 to $120,000	16	10	26
5 bed / 2 bath	$14,000 to $120,000	34	29	36
4 bed / 2 bath	$14,000 to $120,000	62	62	124
3 bed / 2 bath	$14,000 to $120,000	103	94	197
2 bed / 2 bath	$14,000 to $120,000	20	4	24
Multi-family residential properties for sale				
2 to 4 units	$10,000 to $250,000	65	11	76
5+ units	$125,000 to $800,000	2	2	4

Source: www.thechicagomls.com

According to a commercial MLS search on November 29, 2012, there are a total of 9 commercial properties for sale in zip code 60628 and 8 in 60643. There are several properties with leased space for retail or office use; in zip code 60628 there are 3 available commercial rental spaces and there are 7 in 60643. Table 1-3 summarizes available commercial space in the RLE Project Area.

Table 1-3: Available Commercial Properties in RLE Project Area

Use	Size Range	Cost Range	60628	60643	Total
Properties for Sale					
Industrial	15,000 to 81,000 sq ft	$120,000 to $2,800,000	3	0	3
Garage/Warehouse	N/A	$79,900	1	0	1
Place of Worship	N/A	$395,000	1	0	1
Retail/Office	1,000 to 17,000 sq ft	$40,000 to $1,360,000	2	8	10
Vacant Commercial	20,000 sq ft	$799,900	1	0	1
Properties for Lease					
Retail/Office	750 to 3,500 sq ft	$0.09 to $83 per sq ft per month	3	7	10

Source: www.cimls.com

Based on the comparison between displaced properties and the availability of properties to absorb relocations, there would likely be sufficient single-family and multi-family residential property. However, additional commercial, mixed-use, and industrial properties would be needed to supplement the existing available land for purchase and lease. Redevelopment of compatible-zoned vacant land is one viable option for addressing the insufficiency of commercial, mixed-use and industrial properties. Table 1-4 depicts the amount of vacant land by station area (1/2 mile around each station) of each build alternative.

Table 1-4: Available Vacant Land in RLE Project Area

	Vacant Land (Acres)	Vacant Land Percentage
BRT Station Areas		
103rd Street	14.8	3.0%
111th Street	0.10	0.0%
Kensington Avenue	19.8	3.9%
130th Street	41.4	8.2%
Halsted Station Areas		
103rd Street	6.6	1.3%
111th Street	13.2	2.6%
119th Street	103.5	20.6%
Vermont Avenue	7.1	1.4%
UPRR Station Areas		
103rd Street	18.0	3.6%
111th Street	11.3	2.3%
Michigan Avenue	27.5	5.5%
130th Street - South	37.4	7.4%
130th Street - West	28.9	5.8%

As explained above, the Uniform Act requires that replacement property be comparable in size, features, and location; is decent, safe, and sanitary; is within the financial means of the displaced person; and, is located in the same type of neighborhood and be equally accessible to public services and places of employment. If suitable replacement commercial or industrial property cannot be located, some owners could be required to relocate outside of their community.

Appendix I
2014-2015 Red Line Extension Project Update

Red Line Extension

2014–2015 Red Line Extension Project Update

From 2012-2014, CTA evaluated benefits and impacts of four alternatives: the No Build Alternative, the Bus Rapid Transit Alternative (along Michigan Avenue), the Union Pacific Railroad (UPRR) Rail Alternative, and the Halsted Alternative. CTA evaluated three options of the UPRR Rail Alternative: Right-of-Way Option, East Option, and West Option. CTA also evaluated two options of the UPRR Rail Alternative 130th Street station: a South Station Option and a West Station Option. Based on the project description provided in Section 2 of this technical memorandum, CTA analyzed the impacts of these alternatives and station options. The benefits and impacts are included in the technical memoranda prepared in 2012-2014.

In August 2014, based on the technical analysis and public input, CTA announced the NEPA Preferred Alternative—the UPRR Rail Alternative. Additional conceptual engineering was conducted on the UPRR Rail Alternative to refine the East and West Option alignments. In addition, CTA is considering only the South Station Option of the 130th Street Station.

In late 2014 and early 2015, CTA conducted additional engineering and revised assumptions on the East and West Options to refine the alignments. The refinement of the East and West Options consisted of the following items:

- For the segment of the alignment along I-57, CTA shifted the proposed alignment from the median of I-57 to the north side of I-57 within the existing expressway right-of-way. The construction would be less complex, safer for construction workers, and have a shorter duration. The shift would also allow for fewer impacts to Wendell Smith Park for the East Option, and would allow for no permanent impacts to Wendell Smith Park for the West Option.

- CTA modified the curve speeds as the alignment heads south from I-57 along the UPRR tracks. The curve speed for both the East and West Options would be 35 mph.

- CTA shifted the East Option alignment near 103rd Street station to minimize impacts to Block Park and the Roseland Pumping Station.

- CTA modified the curves south of 103rd Street for both the East and West Options to 55 mph to maximize the train speed.

- CTA refined the layout of the 120th Street yard and shop to optimize yard operations. The refined layout of the yard would accommodate 340 train cars.

The refinement of the East and West Option alignments minimizes potential impacts to parks while providing flexibility for future design phases. The Draft Environmental Impact Statement contains the benefits and impacts of the refined East and West Option alignments and supersedes information presented in other chapters of this technical memorandum

Displacement and Relocation of Existing Uses

The refined East and West Option alignments would result in fewer displaced properties than the previous design. The following pages contain summary tables, detailed tables, and maps (both overview maps and detailed maps) showing displacements for both the East and West Options. Figures 1-4 are summary overview maps. CTA conducted a field verification of potentially displaced properties on March 5, 2015 and July 7-10, 2015. CTA identified numerous houses that were boarded-up and uninhabited, primarily between 105th Street and 115th Street on the east side of the corridor and along Eggleston Avenue from 107th Street south on the west side of the corridor.

Parcels and buildings that may be displaced are shown to illustrate maximum impacts and possible locations. Due to the margin for error inherent in predicting displacements based on conceptual engineering, the actual displacements for each alternative may vary from what is shown. Some of the properties shown may not ultimately need to be acquired. Land only property impacts are shown on the entire lot, however, often only portions of the lot would be required. Property acquisitions will be confirmed as project engineering progresses.

Union Pacific Railroad - East Option
Potential Displacements

Affected Count - By Location			
Location	Total Affected Parcels (with and without building displacements)[1]	Building Diplacements[2]	Easements[3]
95th St - 99th St	-	-	21
99th St - 103rd St	40	26	-
103rd St - 111th St	58	18	-
111th St - 115th St	56	28	-
115th St - 117th St	63	31	5
117th St - Front St	12	2	-
Front St - 130th St	16	-	-
120th St Yard and Shop	15	1	-
Total	**260**	**106**	**26**

1) A partial or a full parcel that would need to be acquired
2) A structure that would need to be removed (the land occupied by the structure would also be counted as an affected parcel)
3) Publicly owned parcels that include a roadway are classified as “easements” for this analysis because CTA would require a use agreement with the public entity

Affected Count - By Land Use Type		
Land Use Type	Total Affected Parcels (with and without building displacements)[1]	Building Diplacements[2]
Vacant	50	-
Single-Family Residential	87	75
Multifamily Residential	16	15
Commercial	6	3
Mixed-Use Commercial/Residential	1	1
Institutional (Place of Worship)	1	1
Institutional (School)	2	-
Industrial	17	10
Utility (MWRD)	15	-
Transportation (highway)	-	-
Transportation (railroad - Union Pacific Railroad)	19	-
Transportation (railroad - CN/ME)	3	-
Transportation (railroad - Norfolk Southern)	2	-
Transportation (railroad - Conrail)	3	-
Transportation (railroad - NICTD/CSS & SBRR)	2	-
Transportation (railroad - Chicago & Western Indiana)	-	-
Public (City of Chicago)	34	1
Parkland	2	-
Total	**260**	**106**

MWRD = Metropolitan Water Reclamation District, CN/ME = Canadian National/Metra Electric, NS = Norfolk Southern Railroad, NICTD/CSS & SBRR = Northern Indiana Commuter Transportation District/Chicago South Short & South Bend Railroad

Note: This table does not include easements. Publicly owned parcels that include a roadway are classified as “easements” for this analysis because CTA would require a use agreement with the public entity. Publicly owned parcels that do not include a roadway are classified as affected parcels or building displacements because CTA would need to negotiate a fee simple property transfer or other agreement with the public entity

1) A partial or a full parcel that would need to be acquired
2) A structure that would need to be removed (the land occupied by the structure would also be counted as an affected parcel)

Union Pacific Railroad Alternative - East Option

Note - The following parcels are defined as easements and are not included in the table: Map ID 1-21, 24, 276, 282, 288, 291, 312. Publicly owned parcels that include a roadway are classified as “easements” for this analysis because CTA would require a use agreement with the public entity.

Union Pacific Railroad - West Option
Potential Displacements

Affected Count - By Location			
Location	Total Affected Parcels (with and without building displacements) [1]	Building Diplacements [2]	Easements [3]
95th St - 99th St	-	-	23
99th St - 103rd St	13	2	-
103rd St - 111th St	35	9	-
111th St - 115th St	46	8	-
115th St - 117th St	62	23	1
117th St - Front St	18	3	-
Front St - 130th St	16	-	-
120th St Yard and Shop	15	1	-
Total	**205**	**46**	**24**

1) A partial or a full parcel that would need to be acquired
2) A structure that would need to be removed (the land occupied by the structure would also be counted as an affected parcel)
3) Publicly owned parcels that include a roadway are classified as "easements" for this analysis because CTA would require a use agreement with the public entity

Affected Count - By Land Use Type		
Land Use Type	Total Affected Parcels (with and without building displacements) [1]	Building Diplacements [2]
Vacant	41	-
Single-Family Residential	35	22
Multifamily Residential	4	4
Commercial	13	6
Mixed-Use Commercial/Residential	2	2
Institutional (Place of Worship)	2	1
Institutional (School)	-	-

Transportation (railroad - Conrail)	3	-
Transportation (railroad - NICTD/CSS & SBRR)	2	-
Transportation (railroad - Chicago & Western Indiana)	1	-
Public (City of Chicago)	24	-
Parkland	4	-
Total	**205**	**46**

MWRD = Metropolitan Water Reclamation District, CN/ME = Canadian National/Metra Electric, NS = Norfolk Southern Railroad, NICTD/CSS & SBRR = Northern Indiana Commuter Transportation District/Chicago South Short & South Bend Railroad

Note: This table does not include easements. Publicly owned parcels that include a roadway are classified as "easements" for this analysis because CTA would require a use agreement with the public entity. Publicly owned parcels that do not include a roadway are classified as affected parcels or building displacements because CTA would need to negotiate a fee simple property transfer or other agreement with the public entity

1) A partial or a full parcel that would need to be acquired
2) A structure that would need to be removed (the land occupied by the structure would also be counted as an affected parcel)

Note - The following parcels are defined as easements and are not included in the table: Map ID 1-19, 21-24, 312. Publicly owned parcels that include a roadway are classified as “easements” for this analysis because CTA would require a use agreement with the public entity.

Data Definitions

Column Heading	Definition
Division	Geographic limits based on organization of Technical Memorandum Section 5
Parcel ID	Number corresponding to a parcel
Property Index Number	Cook County Assessor property index number
Address	Cook County Assessor parcel street address
Land Use – Field (2015)	Field-verified land use designations based on Cook County and CMAP data
Displacement Type	Type of effect on parcel by proposed alternative
East/West Option Displacement Use	Proposed project use for parcel
Land Use – Cook County	Cook County Assessor Land Use based on IMP_CODE

▨	Proposed Permanent Envelope - UPRR Common
▨	Proposed Permanent Envelope - UPRR East
🟦	Parcel Easement
🟫	Parcel Affected by Proposed Permanent Envelope
🟥	Building Displacement
⬜	Building Footprint
⬜	Parcels

Parcels and buildings that may be displaced are shown to illustrate maximum impacts and possible locations. Due to the margin for error inherent in predicting displacements based on conceptual engineering, the actual displacements for each alternative may vary from what is shown. Some of the properties shown may not ultimately need to be acquired. Land only property impacts are shown on the entire lot, however, often only portions of the lot would be required. Property acquisitions will be confirmed as project engineering progresses.

- ⬜ Parcels

Parcels and buildings that may be displaced are shown to illustrate maximum impacts and possible locations. Due to the margin for error inherent in predicting displacements based on conceptual engineering, the actual displacements for each alternative may vary from what is shown. Some of the properties shown may not ultimately need to be acquired. Land only property impacts are shown on the entire lot, however, often only portions of the lot would be required. Property acquisitions will be confirmed as project engineering progresses.

Due to the margin for error inherent in predicting displacements based on conceptual engineering, the actual displacements for each alternative may vary from what is shown. Some of the properties shown may not ultimately need to be acquired. Land only property impacts are shown on the entire lot, however, often only portions of the lot would be required. Property acquisitions will be confirmed as project engineering progresses.

Table of Contents

Section 1 Summary..1-1

Section 2 Project Description..2-1

Section 3 Methods for Impact Evaluation..3-1

3.1 Regulatory Framework..3-1
3.2 Impact Analysis Thresholds..3-1
3.3 Area of Potential Impact..3-4
3.4 Methods..3-5

Section 4 Affected Environment..4-1

4.1 Community Profiles..4-1
4.2 Population, Housing, and Employment..4-6
4.3 Ethnicity..4-10
4.4 Age..4-11
4.5 Languages Spoken at Home..4-12
4.6 Community Mobility..4-13
4.7 Emergency Services..4-14
4.8 Community Resources..4-15
4.9 Livability..4-24

Section 5 Impacts and Mitigations..5-1

5.1 No Build Alternative..5-2
5.2 Bus Rapid Transit Alternative..5-3
5.3 Union Pacific Railroad Rail Alternative - Right-of-Way Option..5-6
5.4 Union Pacific Railroad Rail Alternative - East Option..5-16
5.5 Union Pacific Railroad Rail Alternative - West Option..5-24
5.6 Halsted Rail Alternative..5-31

Section 6 Impacts Remaining After Mitigation..6-1

6.1 No Build Alternative..6-1
6.2 Bus Rapid Transit Alternative..6-1
6.3 Union Pacific Railroad Rail Alternative - Right-of-Way Option..6-1
6.4 Union Pacific Railroad Rail Alternative - East Option..6-2
6.5 Union Pacific Railroad Rail Alternative - West Option..6-2
6.6 Halsted Rail Alternative..6-3

Section 7 References Cited 7-1
